Hey, I forgot about the Digital Antic Project! Looks like it's coming
along better than the last time I checked (which was over a year ago)
I was mainly looking to play a few old favourites -- Uncle Henry's
Nuclear Waste Dump (which I was doing a remake of on the ST before I
abandoned ship), Rebound, Biffdrop, etc... especially the JD Casten
games. He did some of the best Antic type-ins... I sat for hours
plugging away at those. :-)

As for the Analog site -- nostalgic, but no type-ins. (Mind you, I'm
not sure if they had type-ins in those early issues; I joined the
8-bit crowd around '85, and so started getting mags around then, too)

Still, I'm going to monitor these from time to time... see how they're
coming along.

Same to you, yours, and let's extend this to all in the ng!

I don't have a "real" Atari any more, but I'm still hanging around. I would never have fretted about Y2K on my Atari, but you should have seen the precautions I had to take with this PC! Happily, it booted with the date intact this morning, and my Atari emulators are still up and running.

Take care, guys!

Wire the left button to be the fire button, and wire the right button to
one of the paddles, so each button is separate.

Atari Hardware and Software for sale

http://www.voicenet.com/~generic On-Line Computer Garage Sale

We are retiring and moving south in the early spring and really need to clear out most of what we have. I would rather ship it to you than move it to the new house. Drastic price reductions have been taken on almost everything in our On-Line Garage Sale. In addition there is a quantity discount in effect until the end of January if you spend over $50 (not counting shipping). Discounts as high as 55 percent. See my web page for details. While you are there play some games, try some trivia and look at our wedding picture.

Of course. My point was that here we are in the 21st century and the
800XL is still ticking. It's the age of the equipment that I was
refering to, not the date roll over. On the date roll over subject
though, the R-Time is kind of confused.

17. Wanted: Boxed Atari 5200 games

Cross-posted to: alt.atari.2600,rec.games.video.classic,comp.sys.atari.8bit,rec.games.video.atari,alt.atari.2600.vcs

I am looking to buy or trade for just about any boxed 5200 game. The games must be complete (box, instructions, overlay) and the boxes must be in very good condition. I'll take loose games if they are really rare (frogger II, Zenji, James Bond, etc.)

I have many 2600, 7800, 400/800, Colecovision, and Intellivision games for trade. If your interested, send me a list of games you have available, and a price list or a list of games your looking for.

Body handling: HTML body converted to readable text

I spent a fair while programming 8051 derivatives (Phillips 80c552's),
and thought they were an interesting architecture. It's another case of
the weird architecture taking over the world. I totally agree that the
'51 is definately un-orthogonal ;) Especially compared to something
like a 9900 ;)

re Z8's and PICS vs 8051's

I've never prorammed a Z8 or PIC but the Z8 on paper
looks like a much nicer architecture than the '51

> the hardwired stack is somewhat objectionable.

I got back into 6502 assembly in the last year and some of it's quirks
struck
me much more having been exposed to other architectures. I think the
hardwired
stack does win the objectionable list for the processor. I also miss a 16
bit index
register, but can live without it. All in all it doesnt seem so bad.
Especially considering
its cycle times.

The cycle time issue got reinforced last year when I pulled out one of my
compaq pc-clones
which has a 8088 at 4.77 mhz. I hacked up some x86 assembler to address the
CGA and
was surprised at just how dog-slow it is. It also reminded me of how
disapointed I was with
the x86 architecture versus other 16 bit architectures. Nobody could call
an x86 orthogonal.

You end up swapping registers about for operations (cx for count, ax,dx for
add etc).
Combine this with its totally outlandish memory scheme (shifting the
selector left four bits) and
you end up wondering why you arent using a 68000 with it's linear address
space.

> duplicate masm's problems...

I think the mind stretched thing isnt so bad. I remember when I was first
exposed
to LISP and PROLOG having my mind stretched fairly severely. I'm glad it
happened,
nowadays when I program I can see things in a totally different way. I
remember
looking at 7 line LISP programs that would take hundreds of lines of
traditional
ALGOLese type coding.

I guess for my argument to hold up I would have to add that 'goto's
considered harmful'
isnt mind stretching it's mind altering spaghetti ;)

> design or poor implementation.

I coded most of my projects on the '51 in HLL. It was an extended pascal
with low level extensions, and it was fast enough for 99% of the work. I
wouldnt
have done it any other way. One big advantage of HLL over assembler
is in correctness. It means a programmer can worry about if the program's
functionality is correct rather than how it is implemented. When you code
in assembler
you end up having all the extra luggage surrounding the primary
functionality of the
program you are implementing. If you take a simple conditional test for
example:

while ((a < b) AND (c
It sounds like the company didnt spend much time thinking about the key
requirements for the device. If it's designed to be used by people then the
user interface is a key requirement ;) It's strange how companies sometimes
do such a good job of one thing, and then totally forget about another.
Perhaps it's a case of the expertise of the people working on the thing.
Lots
of good hardware people, no-one with formal software training.

>
> Carmel A

Gentlemen, it is good to find other folk trying to make use of the
ST as an 8-bit device. I'm yet another myself. :)

There are two ways I've found you can go about this.

1) ST X-FORMER - A cable whose specs I believe are on emulators.com
allows a 1050 disk drive to be hooked up through
the ST parallel port. Not bad. ST X-FORMER doesn't
emulate player missile graphics, but file transfers
work fairly nice. And of course you can get
applications to translate ATR files to XFD format
and store tons of 8-bit disk images on the ST
hard drive just waiting to be turned into 8-bit
disks when needed.
This is currently what I do. I know that in
this case the computer must not go any faster than
8 mhz (for the ST), as for the drive and if a
happy drive will work? Well, uncertain on that one,
but it needs to be set to the drive one position,
even if it is being used as drive one, two, three...
doesn't seem to matter.
I currently have a 1040 STE with modulator
hooked up, which allows me to have the ST sharing
the same monitor as the 8-bit.

2) SIOPC SOLUTIONS - This cable allows you to use one, maybe
two programs on the ST with the 8-bit. It seems
intriguing and I might try it somedays. In both
cases the ST hard drive would in some way allow
at least 8 emulated drives with the capasity of
65 megs each. Not bad. :)
The two programs that would use this cable
(specs at the ape-interface cable website) is
800xldj (strictly uses the ST as a drive), and
perhaps it could be tried on having PC ditto
(PC emulator) running the Ape-interface program
on the Atari.

3) ???? I recently found a program on the XL-SEARCH
website that is for the 8-bit side for a change
(the previous two would run on the ST) and this
allows the 8-bit to see the ST as a drive. Need to
transfer this to my 8-bit and see what it does.

So this is what I've found so far. As it happens, I use a
modified Atari 400 (great machine..) and I find the ST makes a
wonderful hard drive and CD Rom drive controller for 8-bit activities.

Anywho, talk soon!

Doctor Clu

22. Re: Why Atari is still the best

Newsgroup: comp.sys.atari.8bit
Date: 2000-01-01 00:00:00 UTC
From: Greg Goodwin <lady-aramis@geocities.com>

Source record: 47781

At a sci-fi new years party I showed off Star Raiders on my Atari
400 to a younger member. I figured if he liked flight simulator games
he should try that.
The father of the member (the former president of the club and a
real gadget guy) saw Star Raiders playing, and said,

"Oh yeh, I remember that game... Star Raiders. It was that game
that made the computers of today possible. I really wanted to get an
Atari when they came out. Oh well."

This is a man who runs a linux and Windows NT serves from his home
talking this fondly to the memory of the Atari8 and Star Raiders. To
matter the fact, I have run into two others in my club. One who used an
Atari 800 at his business years ago, and another who had an Atari 800
and a 400 for a portable device when he was in the military.

My brother in law has slowly grown to respect the 8-bit for the
amazing6502 machine with specialized graphics and sounds chips, and
though never an Atari user, always PC, he realizes that Atari had a
great impact on the computer world of today.

Amazing. And I, amoungst my computer room (of a Macinotsh used for
internet, a PC that is not used at all, and my Atari 400) find myself on
my Atari 400 most of all.

Now if I could just download newsgroups on the 8-bit somehow. Ah
well.

Hi Greg,

> I've done a fair bit with PICs....

They look interesting, but I've never done more than skim through the data sheets.

>....The PIC bank selects regions of RAM, though any ram location
>can be used in any instruction- is the Z8 arranged similarly?

No, the Z8 treats memory as a single contiguous 64K block. It's been a few years (5 or so) since I last touched the Z8 but, unless my memory is seriously failing me, the instruction set was tailored towards being register oriented (you had 16 "banks" of 16 8-bit registers (or was that 8 of 8?)) so most operations had to be performed on registers.

> As I recall, the only thing I didn't like much about the 6502 was
>the small # of registers....

Yes, coming from the Z80 that was the main thing I disliked too, but it wasn't long until I discovered why "zero page" addressing was invented.... ;-)

>....I really like the indexed addressing- but the hardwired stack
>is somewhat objectionable.

I must admit the fixed location of the stack never really bothered me that much. It was strange, but kind of made sense in the overall scheme of things....

> OK, what is IYKWIM? ;)

If You Know What I Mean.

>....the x86 indexed addressing, though half the trouble was
>Intel's rather loose syntax....

Absolutely, I've always found Intel's ideas about assembly language rather difficult to get to grips with.

A prime example is i8080 vs Z80. Even though they're VERY similar beasts from the programmer's perspective, I found Z80 assembly language CONSIDERABLY easier to learn. Zilogs' mnemonics and syntax struck me as much more logical than Intels'.

>....funny, they even added a "bugs" option which caused their
>assembler to duplicate masm's problems...

Yes, I remember hearing about that a few years ago....brought a smile to my face.

> I wonder about the "savings" and "simplification" gained by the
>use of C/C++ over assembly in embedded work sometimes....
>....doing the nasty critical routines in C/C++ can be asking for
>trouble. Using C/C++ immediately requires more/faster hardware....

Absolutely, one of the companies local to me now use 68K family processors where before they were using 8031 family chips. Another is using i486s and although the system is simpler and more powerful than the old one again they're doing all the low level stuff in "C".

>....I think the hidden cost is that the more plentiful C/C++
>programmers also don't know very much about the realities of
>making hardware go....

Although that's a sweeping generalisation it's actually pretty true in my experience. This isn't their fault though, rather the fault of their teachers.

When I went to polytechnic in 1983 we were taught COBOL, PASCAL and microprocessor systems architecture - with an emphasis on 6802 and Z80 systems. These days, as I understand it, there is little importance placed on the systems architecture part of such courses.

> Nothing like holidays for soaking up time better spent
>elsewhere... ;)

Heh, heh....

Hi all,

I've just been burned off Yahoo by one sega_master_system
(mrlee@ok.freei.net) and blacklisted whilst bidding for otherwise
unbid-for Atari 2600 and 7800 carts. Anyone else had this problem? If
he wanted more money for them why start the bidding at $2? Even boxed
and sealed these games aren't worth a lot of money. If it's because
I'm in the UK then why doesn't Yahoo (or the seller) say this at the
auction?

ta.

This could be PASTFINDER from Activision. You proceeded UP the screen vertically to pass each level, shooting meanies and avoiding obstacles, and then additional levels of the maze opened up. Some were higher radiation than others and there were power-ups you could use like slower radiation, shields, or a full refresh of your radiation level (back to all green).

31. Who owns copyright on old computer mags?

Newsgroup: comp.sys.atari.8bit
Date: 2000-01-02 00:00:00 UTC
From: mister_boffo@hotmail.com
Message-ID: <3874ba5b.55100767@news.wi.centuryinter.net>
Source record: 47698
Cross-posted to: comp.sys.ti,comp.sys.tandy,comp.sys.cbm,comp.sys.atari.8bit,comp.sys.apple2,comp.sys.amiga

(Reposting.... sorry.. my clock was screwed up and messed up
the message threading in the newsreader. Here it is again.)

One of the recent developments in this age of cheap storage
is the arrival of the CD-ROM magazine archive. Some comics
and some magazines (like MAD Magazine) are making available
on CD-ROM the pages from all their old magazines.

It occurs to me that there may be a market for the old
computer magazines from the 80's which have now died out..
Nibble, Family Computing, A+, Compute!, SofTalk, Creative
Computing, InCider...

I would be VERY interested in buying a CD-ROM compendium of
all pages from these old magazines. However, I have no idea
who owns the copyright for the old magazines, so I have no
way of approaching this idea.

Maybe somebody in these newsgroups might know?

Now, I COULD create a website and just upload scans from the
magazines I have, but that would likely draw various legal
problems which I'd rather not deal with. I would really much
prefer that the actual copyright owners are involved in
approving or doing something like this themselves.

OTOH, posting those old mags on a website may be EXACTLY the
way to find those copyright holders! ;)

The Cleveland Free-Net is gone, but the entire Atari archive has been
downloaded and re-indexed into a fast web based format. All the Atari SIG's
were archived. These include:

The Atari 8-bit SIG
The Atari ST/TT SIG
The Atari Portfolio SIG
The Atari Lynx SIG
The Atari Jaguar SIG
The Atari Library

The the original menus have been saved, as well as all the original
content, such as announcments, news, messages, etc. If you're looking for
Atari technical information, chances are its all there just waiting to be
searched.

The archive is at:

http://thefutureis.penguinpowered.com/

This is a non-profit venture, there are no banners or other annoying
junk to wade through. I hope you enjoy having the archive available.

I wonder if anyone on this group has experience with Microsoft basic for the Atari 8bit?
My two question would be:
How does Microsoft basic compare with Atari basic as far as features, ease of use, and power?
Where can Microsofit basic be found, and what is a fair price for the program?

TIA Rich Jackson

Got it here, 144 byte register file includes
124 general purpose registers, each of which can be used as an accumulator,
index register, storage element, address register or part of internal stack.
Four I/O port registers
Sixteen status and control registers.
128 bytes of on chip RAM
2K bytes of ROM
32 I/O lines
Looks like it was limited to 62K of external ram.

I remember the F8 processor was pretty hot for the time too. I started with
and 1802 system myself, 16X16 bit registers.

But the odd thing was the lack of anything close to standard led to some
general problems with both program and hardware development. Everyone kind
of willy nilly used whatever they needed or wanted. For example, one of the
magazines I subscribed to insisted the first thing you should do at the head
of your program is to change the program counter from R0 to R3. I started
subscribing after they had been around a few months, so I never learned why
they did that.

The 6502 seems to have simple rules about things like interrupts.
Essentially save everything you use and maybe the processor status. You
never have more working registers to save then [A, X, Y]. Kind of encouraged
good programming practices.

The prospect of writing a subroutine for a guy who wrote a program that was
called by an interrupt for hardware added by another guy kind of led to a
bit of confusion.

ALL my Gazettes and RUN and AHOY and diverse other CBM magazines were
destroyed in a basement flood.

A CD of Gazette and COMPUTE!, if nothing else. would get me to open my
checkbook without hesitation.

In my limited experience, finding the copyright holders of those old publications is difficult. When you can find them, they are usually happy to give permission to put the old material online, if you don't charge for it. Those copyright holders have inevitably moved on to other things, and don't want anything to do with ambitious projects to put old magazines on the net. Nor do they tend to have any of the old editorial material in digital form any longer. So fire up that scanner.

I've received permission to put old Antic and STart magazines on the Web, which I'm doing at www.atarimagazines.com. I've also received permission to put material from Creative Computing online, but I haven't had the time or energy to do anything there.

> more though...

What do you think of the orthogonality and reducing the semantic gap
issue nowdays ? It seems like the second the RISC's and the good
compilers came out that orthogonality and semantic gaps became a
non issue. (How many VAX style CISCs do we see nowadays ?)
It's weird, back when I was playing on my 6502, I was reading about
these great CISC's like the NS16000 series. Nobody really gives a damn
what cpu they are running now, as long as it's fast enough and
has some decent development tools available for it. For that reason
the 8051 was the embedded cpu of choice for us. We had experience with
it and had figured out all the nasty quirks of the tools for it. The target
application also matters too, I cant imagine rendering postscript on a
8051 ;)

< Comments on how slow the 4.77 mhz 8088 is deleted>

>
> Single cycle operations do make a processor fast- PICs can clock up to
> 20mhz, which yields a 200ns instruction cycle; 5 million instructions

I was always impressed with the speed of the 8051's I used. They were
clocked
at 12 mhz, and are SLOW compared to a 6502. I remember hooking a scope to a
port I was toggling to identify entry to a serial interrupt service routine.
It was
managing 22000 entrys /exits a second. I was actually trying to figure out
why the
main program was running so slow and found I had a runaway interrupt problem
;)
The 8051 at 12 Mhz, could pull about 1.5 mips from memory. So your PIC is a
tad

quicker. ;)

< stuff about x86 register swapping nightmares deleted >

When I was first exposed to LISP and PROLOG it was a little like being
hit in the center of the forehead with a lemon covered gold brick ;) The
recursive comments are definately true. My Lisp and PROLOG skills are
at baby level. Even at that level I can appreciate the different mindframe
needed. I've never worked on a big lisp system either. I'm not sure if it
would be worse than a big 'C' system.

< Stuff about a programmers hiding important control-flow stuff>

Dont you love it when a programmer important stuff and doesnt
tell you. Or even better when a tool changes something for you without
you asking for it to be changed.

I remember my first 386 protected mode programming course as a student.
Our programs all mysteriously died because TASM was optimizing the
LONG FAR JUMP which flushed the instruction queue into a near jump.

Can you write a quick tool that takes the output of the compiler and
automatically
removes the redundant ram bank selects or is it hard to determine just which
bank you are located at ???

I was lucky we always had a 27256 or similar so 32k was a nice bunch of
space
and we also had a seperate 64k of data memory. The security system I was
working
on stored logs in it. It used to last about a month for typical usage,
where the system
logged how much movement it detected in a room.

O man, I have seen embedded systems developed in that kind of environment,
you got it right when you said scary...Just wait until the original
programmer
disappears and the company has to fix something... Some poor software
engineer
and hardware engineer are gonna have to decode the stuff. Figuring out why
a latch was polled when it doesnt seem necessary is never fun without good
hardware and software documentation.

> issue nowdays ? It seems like the second the RISC's and the good

I guess a more highly orthaognal architecture with fewer protruding uglies would be in better taste- but with decent compilers the need for it is somewhat less. Frankly, most of the x86's richness is wasted on me at least- to be sure theres all these wonderful instructions to do all sorts of esoterica, but I always seem to be playing around getting data into the right registers. I do like the architectures with lots of registers, even on RISC style hardware, I think it could frequently save code space simply because there are fewer constraints on the dataflows.

> it and had figured out all the nasty quirks of the tools for it. The target
> application also matters too, I cant imagine rendering postscript on a
> 8051 ;)

<<shudder>>, I'm doing some 8051 assembly now plotting points on a LCD graphic panel, pixels packed into bytes, mapped to the display controller. Then throw in the FP to get decent diagonal lines. Eww. Its a home project so I don't have a decent compiler, just assembly and Basic on a 12mc 8051AH. My current nightmare is the text mode output, which is supposed to be independent of the dot graphics is indeed printing properly, but the text data is appearing as garble in the graphics display. Something about the address space assignments of the text and graphics memory banks I'm pretty sure- but where where where...

> ;)
> The 8051 at 12 Mhz, could pull about 1.5 mips from memory. So your PIC is a
> tad
> quicker. ;)

But the 8051 has external ram, our device has only internal RAM and EPROM- so we're stuck at 8k code and 300 bytes or so RAM. Don't some of the 8051 clones/derivatives make it up to > 40mc or so?

> needed. I've never worked on a big lisp system either. I'm not sure if it
> would be worse than a big 'C' system.

Well, when the Emacs people start talking about the OS acting as their device driver, there must be prodigious wonders under the hood... One of these days, I'll run into somebody who does AutoLisp programming (AutoCAD's Lisp implementation)- I'm really curious about the design approaches taken to get Lisp code to draw stuff.

> Dont you love it when a programmer important stuff and doesnt
> tell you. Or even better when a tool changes something for you without
> you asking for it to be changed.

But surely all those new features make it ever so much better, right??
;)

>
> Can you write a quick tool that takes the output of the compiler and
> automatically
> removes the redundant ram bank selects or is it hard to determine just which
> bank you are located at ???

Its a 2 pass macro assembler, the first generates assembly and the 2nd
feeds it into an assember. An optimizer could remove the redundant
bank selects, and the assembler would fix up the references, but the
damnable PIC architecture will cause trouble. It divides its 8k
address space into 4 2k pages, but code cannot flow over the page
division- the boundry must be jumped over. The 1st assembler pass
watches for this, bombing the compilation if the IP passes over a page
boundry. Thus I can't generate assembly output that exceeds its
address space, and then be optimized back into place. So, I think I'm
stuck. The assember people (Microengineering Labs) are very
responsive, I asked them about it and they are very aware of the
efficiency issues. As I'm sure you imagine, they have a list of
things to deal with in each release, but they say the efficiency will
improve (it has to some degree the past several releases).

>
> I was lucky we always had a 27256 or similar so 32k was a nice bunch of
> space

So roomy, and comfy! So what do you need all that space for, a
postscript interpreter or something? ;)

> and hardware engineer are gonna have to decode the stuff. Figuring out why
> a latch was polled when it doesnt seem necessary is never fun without good

Thats such a tough issue- I think its lots tougher than the same
scenario with regular PC software; its so much harder to understand
whats happening inside the processor, you often can't be sure if this
chunk of odd code is actually doing something important- either for
the app itself or the processor or the peripheral chips or.... Then
you go clean up the code- make it more efficient you know, and bring
the whole thing to a crashing wreck. I'm glad I won't be the one
dealing with that little nightmare.

Hi and Happy new year.

I remember a game from many years ago and was wondering if anyone else
remembered it (and if it was on the net :)

The screen showed a maze and you had to escape before radiation killed you.
This was not a 3d maze, you could see the whole maze.
Doors opened and closed at differenct intervals.

That is all I can remember but any help would be appreciated. I think it
probably came from a magazine but I have had a quick look at the analog &
antic sites and cannot see anything there.

Thanks in advance, Denver.

I did a little research when we were studying which processors to use
in our systems, as I recall, the Z8 is set up to compete with PICs and
COP8s. It bank selects its internal RAM, but I don't recall if there
is also code space bank switching. It doesn't directly prevent
orthagonality, but you always have to be aware of which bank is
selected so you can address the right register. I don't remember much
more though...

> space.

Single cycle operations do make a processor fast- PICs can clock up to
20mhz, which yields a 200ns instruction cycle; 5 million instructions
per second; not so bad for a single little chip.

Quite right about the x86 register swapping, mul and div imposing the
more outlandish gyrations- I can NEVER remember which registers to put
stuff into and which ones it comes out of, or even worse, forgetting
to clear the right registers when working with smaller data widths.

Real mode segmentation is distilled agony, protected mode sounds
better, but I've never used it. It has (very occasionally) come in
handy- but a 16 bit address space within a segment is just too small,
and as you say, you're always having to drag those 4 bits around.

I like lisp very much, I use it for little test programs, and you're
right, it does give a different perspective. Often the C/C++ mindset
is to slog away from beginning to end without considering the
subtlties of what the language offers. Lisp introduces you
immediately to recursion and a suprisingly disciplined approach to
program structure- I find Lisp programs often seem to just organize
themselves in a natural, modular approach instead of evolving into a
gnarled tangle. But then, I've never worked on a big Lisp system
either... ;)

Prolog really threw me for quite a while, I still don't feel
comfortable with it- but talking about it is a sure way of getting
Visual Basic people to quit going on about their OCX controls and COM
interfaces...

>
> I guess for my argument to hold up I would have to add that 'goto's
> considered harmful'
> isnt mind stretching it's mind altering spaghetti ;)

I've had the C setjmp and longjmp bite me a few times in one project-
the original programmer buried them in the system so he could break
all the way out to the main loop without bothering to do an ordered
exit from the control flow. It left all sorts of memory leaks and bad
stuff- although convienent in some ways, it was a real pain to deal
with.

> while ((a < b) AND (c something;

> you are
> trying to express. I've heard the opinions of both side's argued

Very true- and all that extra stuff has to get debugged when things
change and all those manual tests provide loads of opportunity to make
errors. Although we didn't have a more structured HLL available, we
use Basic for the main system logic, saving the assembly for sensor
polling, timing, etc- where speed is critical. Unfortunately our
Basic compiler generates redundant ram bank selects, so we've often
had to redo routines in assembly to save eprom space (we have about
100 bytes left in the CPU's internal 8k eprom).

> Lots
> of good hardware people, no-one with formal software training.

They're in a somewhat bad position; the programmer is an independent
consultant who retains ownership of the code. He also wrote their PC
software and owns that also. Presumably that reduced costs somewhat-
it also means they are completely beholden to him. Apparently they
don't even have copies of the firmware or PC source. From other
conversations we've had with them, their controller hardware guy works
the same way- the company doesn't own its product's circuit boards.

Kind of scary...

(Why 2000 is last year of 2nd millenium.)
Some monk or priest who started the BC/AD calendar started with the
year 1, not year zero. There is no year zero, only year 1 AD and 1 BC.
It is a sorta nitpicky technicality that the thousandth year is
1000-2000-etc.
Popular thought is that 2000 is the beginning of the new millenium, but
I don't argue with those who want to say 12/31/2000 will be the last
day of the second millenium. Calendars changed along the way and it
wasn't until about 1500 that we got the present calendar.

Unfortunately, it may be nigh impossible to get the copyright
permissions for reprinting even a single issue on CD-ROM. The problem
is that many magazine contracts leave the copyrights for articles with
the authors; the magazine only bought the rights to print the article
in that one issue. Some magazines may have done their contracts
differently, though, in which case you just have to track down who
owns the magazine now.

Oh not that crap again. People were alive on this earth long before
Christ's existence started a new calendar, so, if you want to be so
precise, then we have already past the 21st century. What is
important is that the numbers flip. We may as well just play along as
if we started counting at 0 (like we should have) instead of 1. When
a decade changes you don't hear anyone scream about it not REALLY
starting until there is a 1 at the end of the number do ya? No.
Let's not start it now.

>people ignore this.....
>

If we have really gone past the 1900s, then we MUST be in the next set, which is the 2000s. There is no in between spot. We, as people normally start counting time AS IT HAS PASSED. It may be that 1AD was started right away instead of wating til 12 months passed by, but most things, peoples ages included start at zero. When you are born, you are not said to be 1 year old. You are said to be so many weeks or months. Once 1 full year has passed, then you are said to be 1 year old. As soon as you are born, it is said that you are IN YOUR 1ST YEAR. You are not yet 1 year old. When you have your 30th birthday come, you are then at that time truly 30 years of age, and you start INTO your 31st year.

When you start college, and someone asks you how much time you've spent in college you don't say "1 year." You say something like "I just started, I'm IN MY 1ST YEAR." It is only after you have completed a year that you can say you've had a year of college.

So to me, even if our calendar started (improperly) at 1, what is important is the numerical expression. We are IN the 21st century (just look at the date on the calendar) because 20 centurys have already passed (according to the calendar). If we want to nit pick about starting at 1 or 0, then let's just scrap the whole thing and try to figure out EXACTLY when people were in first existence, or

EXACTLY when the earth came into being.

>I wonder if anyone on this group has experience with Microsoft basic for the Atari 8bit? >

Some -- enough to probably make an accurate reply. If you need string arrays, MSB has its place. If you don't, Turbo Basic offers more.
Even for the string arrays, Basic XL and Basic XE offer that and a whole lot more. MSB is
definitely faster than Atari 8K basic, but it is
not as fast as TB or BXL or BXE. It uses
a lot of memory. The cart version gives
a little break there, since you have a choice
of loading the extensions or not. I only know
of a couple of applications that were written
in MSB -- lack of a runtime package or compiler hurt it's acceptance, I would think. Last time I looked, both (see below) B&C Computervisions* and Best Electronics* still had a version of it, and I think the price was around $25.00. Bottom line--if you are a collector, it's certainly worth having. If you are after something quite functional, go for one of the others, especially since TB is free
and offers many added features found in MSB, but with (essentially) the same syntax as Atari 8K Basic, plus a compiler package. I also should mention that MSB's differences in syntax are pretty significant from the other Atari Basics, so there is a "learning curve" unless one has already had MSB experience from another platform.

I would sacrafice a small goat to get ahold of even just one copy of an early-mid 80's "Creative Computing" magazine. I've contemplated going back to my old High School, where I know they had them, and making some photocopies...or something...

SO fine to recall in each issue, so many different machine that just were doing their own thing--their own OS with their own proprietary interfaces, etc. The Mindset, GRiD machines, Dimension 68000, Osbornes, etc. Ahhh, the memories. I'm actually surprised I got so much out of them back then...I was only 8 yrs old in 1980. But man...I surely did. I have no idea what happened to them. Or to my many A+ mags. My only real treasures are some real early MacWorlds and NeXT Worlds. I'd even like to have my old stash of Info mags back. I can almost feel a tangible pain in recalling them.

61. 410 program recorders need a home

Newsgroup: comp.sys.atari.8bit
Date: 2000-01-03 00:00:00 UTC
From: 8bitz@my-deja.com
Message-ID: <84qnjq$h2g$1@nnrp1.deja.com>
Source record: 47720

Greetings 8 bit programs.
I have 2 atari 410 recorders for trade or shipping cost. They both were running funky and I took one apart and found the main drive belt is loose. I tried some belts from a cassette player but no go. I looked at the other one and it appears to have the same problem.
I did manage to find the ATR's for the files I was trying to load fome cassette and having an SIO2PC setup now makes it kinda redundant to have a working 410.
I hate to throw these away since one I paid $50 for one of them 13 years ago...
Anybody want one or both of these for what it costs to ship?

Later

What about the ever-famous (and best CBM mag ever) - that being
TRANSACTOR?

I'm in toronto (where they were based) and there's not a trace of them
to be found.
Thankfully I have just about every issue ever published! (still in good
condition, except the odd one).

Yes I am in the US, guess I forgot to mention that. Does he have fine print at the bottom of his auctions stating he will not accept bids from international bidders, and the consequences? If not, just file a complaint with Yahoo auctions.

I have MS BASIC for the 8-bit. It doesn't turn me on all that much.
From what I remember, it has more standard type string handling (ie
LEFT$ RIGHT$ etc). I happen to like Atari BASIC's 'crude' string
handling.

Yahoo Auctions has always been a weird auction IMHO. If you search the auction for Atari items youll notice only about 10 percent have been bid on. Also you have to remember Yahoo auction is free so you get some scumbags on there that ruin the place for others. Where as Ebay people pay a listing fee. I think this keeps alot of problem people away. You could complain to Yahoo but, I dont think they will do anything.

Just my 2cents.

That reminds me of visiting Toronto, perhaps it was as late as 1989,
and visiting a surplus store on Queen Street, and seeing part or was
it a complete unit, of an adaptor for the Commodore 64 so it could
run programs from other computers. It was add-on hardware, and I
think it added emulation for more than one computer, but definitely
the Apple II. I can picture an ad for the unit, but the rest of the
details are hazy. Needless to say, the units being sold at the surplus
store were cheap by then.

Though I haven't seen any from him in a while, I have seen posts
from Jim Butterfield, who wrote extensively about the Commodore
computers. I know he wrote for Compute! and I think he wrote for
Transactor and maybe even was on the masthead. I think I've
seen him in alt.folklore computers and I know I've seen him in
the past in the Toronto-local newsgroups, most likely tor.general

I heard of 8051's at >30 mhz a few years back so I wouldnt be surprised if
they
do 50 mhz now. A better place to start would be changing the
microarchitecture
so that it didnt take so many clock cycles per instruction ;) I'd much
rather work
with a cpu that executes instructions in less clocks than one that's just
burning
rubber ;) Kinda the old 3.5 Mhz Z80= 1 Mhz 6502 argument.

Hmm sounds like you need some extra features in that assembler, like
automatically adding jmps to cross 2k pages. That sounds kind of nasty
but I guess you get used to it.

> >
> > I was lucky we always had a 27256 or similar so 32k was a nice bunch of

> postscript interpreter or something? ;)

It was a security/room usage monitor (RUM). The idea was you stuck these
things up in rooms and could see how much they were used. It used
a PIR sensor and logged the number of times it was triggered. It could
turn the lights on and off when people walked in a room. We had an
MCAS (Magnetic card access system) too. You swiped your card thru,
it talked over an RS-485 network to the RUM, unlocked the door and switched
the lights on. After 5 minutes it would switch the lights off (Fluorescent
so you
save power not switching them on and off). So it had I2C drivers for RTC
and
EEPROM, ADC's, DAC's, LCD (MCAS), RS-485 interrupt driven comms
etc. It worked pretty good. Once we downloaded the data from it and
analyzed it to discover lots of strange readings at 3 AM. We were wondering
if the place was haunted until we found out the electrician liked working at
3 AM.
;)

Yeah I'm glad it's not me too.

I've thought lots about writing a modern cross compiler for the 6502, a pascal derivative (or c derivative) like action. Still just a pipedream at this point in time. I've never written a compiler, and would need to read up on compiler design but I think that it's doable. If I had a nice pascal type language here it would save me heaps of time.

A lot of places try to get your credit card number now "oh no we will never use it, it is just for security." After Ge ocities cashed in with Yaho o they asked for credit cards. I said "why? I have had this page up for 2 1/2 years." They sent me a form letter stating they required the credit card to protect minors. But my page had no violent or sexual content. And if providing a credit card is to demonstrate I am an adult, then how does that protect minors. And why shouldn't minors have a web-page?

It didn't make sense, but it wasn't about making sense. It was about getting the credit card so they could zing me with sneaky charges when I wasn't looking. Geocit ies has demonstrated their sneakiness and were busted by the law for marketing their users' info, when they promised not too.

In the case of eBay on the other hand, I can see where requiring a credit card cuts down on fraud problems that are immediate and serious for eBay. A talented criminal can get a throwaway email address and fake the other things and then rip off people on eBay. So I think eBay is reasonable in requiring a credit card.

Hi Kevin,

Do you have permission to post the entire contents of every issue of
Creative Computing, or just selected articles or sections? Do you have any
idea how copyrights last on magazine articles? It might be near the end of
some of the earlier issues anyways.

One possibility for those magazines that you were unable to contact: Scan them and post them anonymously in binary news groups and place them on free web servers.

Shit and I cleaned out my basement this last summer and tossed out
about 6 years of commodore magazines, run, transactor, computes
gazzette,a nd a couple other relating to the c64/128 and Amiga and all
were in like new condition, neatly filed away in boxes.

Guess I should have kept them sound like they could have been worth a
few bucks.

Ebay now requires new members put a credit card on file too. This
greatly reduces scammers. It introduces a bit of accountability.

Hello Lance,
I have most Mastertronic games (Mastertronic was/is a subsidiary of Virgin/UK) on a standard tape. Since they have no copy protection at all, it was easy to do a Cass.-Simulator copy onto a diskette. Unfortunately nearly all Mastertronic Atari games are merely conversions from other platforms, this is not so bad, but unfortunately they have not been tested fully. Thus most (if not all) Mastertronic Atari games have bugs !! Examples:

1)In "Universal Hero" there is a code bug, you have to give in a codeword at the end of the game, to finish it. but, the game does not acceppt the codeword given somewhere in the game...
2)The game "Colony" displays garbage (over the whole screen!) after a certain playing time. This especially happens, when you ordered some goods with beacon powered on, and these goods arrive. You go to the landing space and now, the whole screens shows garbage. If you leave the landing space then, all other screens also show this garbage...

There are many more games, than these two, that feature one or more bugs in the Atari version. Looks like Mastertronic has not done a good conversion job... So, if you are willing to burn these games onto a cart, you should at least try to correct these bugs, if you can. Some bugs make Mastertronic games unplayable, others cause crashes and some make it impossible to finish the game...
greetings - Andreas Magenheimer

Lance,

I know what you mean. When a friend of mine and I were trying to
get a backup copy of "Return of Heracles" from Electronic Arts, they
simply let me know that they didn't support Atari.

I laughed with them, explained that at one time, back in the dark
ages they did. They seemed confused. I asked to speak to someone who
might have a backup copy of the program in archieve. They did actually
transfer me, and the technical staff let me know they didn't bother
doing this (which seemed strange to me, since you would think they would
at least keep a ATR image on some PC somewhere since THEY did in fact
make the program). Atari was such a distant memory that they said there
was nothing they could do about it.

Sadly, a month later, the loyal copy of Return of Heracles wore out
after nearly a decade of use.

(So I hope to eventually get a Ape interface cable and get this
ported over to a disk again.) ;)

My old school had a huge collection of Byte magazines from the late 70s
through mid 80s. Now, back then it was a REAL computer magazine. Not like
the current Byte. I remember when...Byte was full of hardware projects! I
spent many a lunchtime in the library pouring through the older issues, I
even photocopied some of the more interesting articles. I still have two of
them. "Apple Audio Processing", a simple A/D and D/A converter for the Apple
(the Apple II, there was no other kind of Apple back then) for recording and
playing audio through the game I/O connector. "A Homebrew Graphics
Digitizer" was a pantograph-style arm with a pot at each joint, which
plugged into an A/D converter or joystick port, and gave you the world's
cheapest graphics tablet.

Would love to know if anyone out there has either the 1050 disk drives (I think that's them.) I used to have an 800XL but I lost the stupid thing. Kinda brings back old memories. Just thought I'd ask. :)

93. Large lot of 8-bit Items - For Sale or Trade

Newsgroup: comp.sys.atari.8bit
Date: 2000-01-05 00:00:00 UTC
From: C Schell <schell@san.rr.com>
Message-ID: <3872E2C7.81FFEF51@san.rr.com>
Source record: 47652

Hello,

I recently came upon a large lot of Atari 8-bit Items. As I only have an atari 8-bit for games, I have little use for most of the items. So I thought I would list the items in this news group in hopes that some of you will be interested in them. I haven't yet decided which of the games I am going to keep, but if you want some, make me an offer and maybe you can help me make up my mind.

Many of the items listed below have the box, manuals, etc. For more details look at my webpage:
http://home.san.rr.com/seashell/800sell.txt

In terms of trades, I would be most interested in Atari 8-bit Cart based games, or rare Atari 7800 items.
The carts I currently have are listed here
http://home.san.rr.com/seashell/800carts.txt

Thanks for looking,
Chad

Just out of curiousity...
What do you use as a cartridge case? Do you use old common carts, or have
you had alot of empty 8bit atari cart cases made especially.

Also, a question you may not be willing to divulge,
What is the process of making a cart from a image of the game?
Is it fairly easy? Is it just a process of writing the data to the ROM.?
or do you have to write a boot header to it first?

I'm just interested in the whole process. As I love the Cartridge format.

I'd love to scan them, but I'm in the Netherlands, I guess that's a bit too
far to send them?

Or maybe someone in the Netherlands has similar stuff for me to scan?

Let me know.

Welcome to comp.sys.atari.8bit, the Usenet newsgroup for discussion about the
Atari 8-bit family of computers! These include the 400, 800, 1200XL, 600XL,
800XL, 65XE, 130XE, 800XE, and the XE Game System.

Many topics are covered over and over again. To help alleviate this trend,
several people volunteer their time and energies by maintaining Periodic
Informational Postings for this newsgroup. Please take a moment to refer to
these documents before posting to comp.sys.atari.8bit. The answer to your
question may already be readily available!

Users of comp.sys.atari.8bit actively maintain the following Periodic
Informational Postings:

Atari 8-Bit Computers: Frequently Asked Questions / Michael Current
mailto:mcurrent@carleton.edu
http://www.faqs.org/faqs/atari-8-bit/faq/

Atari 8-Bit Computers: Vendors and Developers / Michael Current

I'll email you from home this evening, I'm taking a neanderthal brute force approach with the current code, something more flexible would be a great. Thanks!

> with a cpu that executes instructions in less clocks than one that's just
> burning
> rubber ;) Kinda the old 3.5 Mhz Z80= 1 Mhz 6502 argument.

Single cycle instructions sure do make timing more predictable. As I recall, on the x86, cycles per instruction vary with the instruction from 1 to over 12- I think mul/div have even more. It makes for tricky optimization.

<snip 2k incarnate evil>

>
> Hmm sounds like you need some extra features in that assembler, like
> automatically adding jmps to cross 2k pages. That sounds kind of nasty
> but I guess you get used to it.

Its sort of like dragging around a 3rd leg. In the source, each page is begun by an inline ORG. Within pages, the basic code is normal enough. The compiler will issue warnings if the assembly output from a previous page slops over. The exercise at this point is to move subroutines between pages so each is <= 2k. It is rather tedious. As a consequence of these pages, code bank selects must be set up before each interpage branch, so each call (or jump) in each routine must be preceeded by one or more instructions to set the registers. Each page requires additional instructions (page 0 needs a single one as I recall). So, when a call/goto is into page 0 from page n, the overhead suffered in page n is only 1 instruction. When the call is into page 3, the overhead is 2 instructions. Lots of calls means lots of space burned up in overhead. This generates a optimization problem of moving commonly called routines into page 0 and seeing the impact on overhead, then adjusting the routines to maximize the codesize reduction. A very significant pain... I did spend some time working on an optimization program which would permutate the routine orderings and automatically find the most efficient, the problem is its very difficult to automate the compiler because it doesn't let you just turn off errors.

<snip cool embedded project>

pascal
> type language here it would save me heaps of time.

Its pretty Deep Magic to do it well. I've toyed with writing a basic compiler, but dealing with the expression trees get a little subtle- and thats just the first phase. It might be easier to write a sort-of Lisp compiler. In a previous life I wrote a bunch of subroutines to do formulas for the Grid control (Microsofts awful spreadsheet control) in Visual Basic 3. Each formula was written in Lisp syntax and loaded into the solver, which then ran and computed everything. The answers were retrieved and displayed in the spreadsheet. Its not so hard to make a brain damaged left to right arithmetic solver routine, but its MUCH tougher to do one that handles operator precedence the way people expect. Using Lisp completely bypassed the expression parsing issues, allowing the use of a much simpler recursive expression solver- very clean and fast to write. Of course, 2 months later, the first proper grid controls came out, so my nifty code went right out the window... overall, to the good, because the grid control is so awful to use.

Along these lines, it might be possible to write a simple and effective lisp-like compiler, although the design of the list management routines would take some thought. Not that full blown, standard list routines would be required, only that lists are pretty handy sometimes and it'd be useful to have something approximating them.

103. Question about the 1200/1400XL keyboard

Newsgroup: comp.sys.atari.8bit
Date: 2000-01-05 00:00:00 UTC
From: Greg Goodwin <lady-aramis@geocities.com>
Message-ID: <38737976.253F@geocities.com>
Source record: 47662

Alright, here's some trivia, and it will help me with my computer
as I try to get it to do more and more cool things. :)

My Atari 400 was modified to "frankenstein" status year ago. And
the trend is continuing. It was given 48K of ram (I know 64K is
possible on a 400... will look into that later), and when I grew tired
of the 400 keyboard (back when I was using it as a serious computer) I
happened to stumble upon a keyboard kit at Radio Shack.

The people at Radio Shack said the kits were the excess keyboards
that Atari had sold them for a song. (this was back around 1987 or so).
It was also said it was an Atari XL computer that didn't make it.

My dad went through all the trouble of doing all the wiring and ram
neccessary (back then I was just a teenager playing games and BBS'ing)
to have a XL keyboard work on an Atari 400. The result was, a keyboard
bolted unceremoniously on the top of the computer that worked pretty
good.

A few months ago, my dad and I together brought the computer out of
mothballs, and went through the trouble of mounting the keyboard inside
the computer's case. The result here is a unique and actually good
looking computer. Today I got tired of the START, OPTION, SYSTEM RESET,
BREAK, ATASCII, and SELECT keys all being unmarked, so I took a
defective Atari 400 keyboard and carefully removed the sticker/keys off
the keyboard and rubber cemented them on the Franken400's keyboard.

But with this keyboard, there are still FIVE unmarked keys.

The keyboard matches in appearance either a 1200 or 1400 XL
keyboard. And it maps out with 400 something like this...

SYSTEM OPTION SELECT START X X X X X ATASCII BREAK
RESET

The "X" keys are the unidentified keys. The three keys to the left
of the ATASCII key give a key click sound with no displayed character.
The other two next to the START key give no response.

So any light that can be shed on this will be most appreciated. I'm
currently trying to get the macro keys on BobTerm to work and I'm
reading the documentation now. I doubt the 400 has the smarts to use
the unknown five keys, but it would help to know what they were.

Take care, and thanks Atari fans!

Doctor Clu

104. RTime clock cartridge/ATR8000 info

Newsgroup: comp.sys.atari.8bit
Date: 2000-01-05 00:00:00 UTC

Source record: 47664

I'm afriad I have to agree with Bowling and Danver (?) on this
one. In my case, I solicited door to door to sell 17 newspaper
subscriptions to win a contest to win a Atari 2600. I was ten at the
time. My sister, age 6, helped sell an additional 5 subsciptions (using
her cuteness factor) and got the Pac-Mac cartridge.
Years later, I sold the 2600 and used the money from it, plus a
little more, and bought my Atari 400 (which I still use) for $150
dollars with a $50 rebate from Best Products.

I know we may sound like a bunch of old fogies here, but we relay
these stories to you with pride, and let you know that if you want
something bad enough, with a little sweat, you will get it. :) That
little bit of sweat has made the difference of my 400 being my primary
8-bit machine (though it only has 48K) verses, the XL and XE machines,
which are hardley used. (grin)

Take care, and take your time and work to get some equipment you can
be proud of.

Message-ID: <38737D07.58DA@geocities.com>
Source record: 47665

With a 600XL, similar to a 400 (which is favorite 8-bit of all
time) you need to ask yourself one vital question:

Does this computer have more than 16K of memory?

If the answer is no, then you might want to look into what it will
take to get it upgraded, because 16K really isn't enough to use a disk
drive effectively.

How will you know? Well there is a basic routine that will answer
that. My apologies as I have forgotton it temporarily (just returned
from the ST world, so it's been a while). But hopefully some kindly
programmer could enlighten us here.

Good luck on the 600XL. That is a fun and very portable 8-bit.

Th keys at the top of my 1200XL read out as follows: Reset, Start, Select, Option, F1, F2, F3, F4, Help, Atascii, Break

Now a 400 did not have a provision in hardware for the Help key, nor did it for the F1-F4 keys so actually you could wire them up for what ever you wanted I guess. I can't remeber off hand how the 1200 used the F keys, it has been too long, but I hope I was of some assistance.

we have 3 different boards,but every game may reqiure a different configuration,if it can be done,every program will reqiure its own custom code ,and endbyte code routines to run from the cart port,so there is no easy one answer,it just depends on the game,also many just cannot be done,and the size of the program may not have a thing to do with it,we have always wanted to do the tempest clone live wire,its small so it should be a cinch right,wrong! the programmer scattered his code every where,and it just cannot be done,this took us over 2 years to accomplish just the first cart program,now some are coming easier,but its still alot of work,each one is a custom job,thanks,

The provision is in software, ie the OS. Those 5 unmarked keys are
mapped just like any other key except for start, select, option and
reset. tho reset on the 400/800 is a NMI reset, Not a hardware reset
like on XL/XE.
A quick rewrite of the os and the keyboard map would get tose 5 keys
going.
Eaiser to rewrite a keyboard handler and have it in ram and change the
IRQ pointer for a keypress to your new routine.

111. FS: Atari 8bit carts -U.S. only

Newsgroup: comp.sys.atari.8bit
Date: 2000-01-05 00:00:00 UTC
From: KBR <kroberts@northlink.com>
Message-ID: <jDPc4.9736$Ce.142949@monger.newsread.com>
Source record: 47670

I have found a plastic bag in my storage unit that contained some Atari 8-bit carts from my Atari days. I thought I would offer them for sale to any one who would offer a price that would make it worth the trouble to mailing them out. I no longer have an Atari computer (I used a 800xl back in the eighties), so I have no way to test these carts, but I see no reason why they wouldn't still work. I am offering them 'as is'. Any collectors offering a price, please email me as I don't check the news sites very often. Below are the carts;

Name Company cart case
notes
Dig Dug by Atari Metal Cart case
Jumpman Jr. by Epyx Plastic case
The card seems to be loose in case
Donky Kong By Nintendo Metal Case
Missile Command by Atari Metal Case
Jumbo Jet by Thorn Video Plastic Case
Case Slightly Modified to fit later Ataris
Popeye By Parker Bros. Plastic Case
Label ripped
James Bond 007 By Parker bros. Plastic Case
Pitfall By Activision Plastic Case

Once again all carts are for the Atari 8bit machines, they are carts only with no manuals or boxes. Though they all worked fine the last time I tried them, they have been in storage a decade or more. They are 'as is' not returns. Please email me any offers. Thank you.

LiveWire shouldn't be too hard, since ANALOG also published the source code. Re-assembling it in the cart space should do nicely - just make sure to move video memory so that it will run on a 16k machine.

The segmentation may be due to a problem with MAC/65; I seem to recall the early disk versions assembled programs in a series of small sequential chunks. To fix that, a much later edition of ANALOG ran a program called "Streamliner"; it will rewrite an object file in contiguous parts.

Cute. With functions like that it sounds like it was very much
the business machine.. and to disable the keyboard.. posssibly to take
some of the load all the processor.

How strange that the Atari 8-bit started to look and feel more like
the the computers that came before it. At least this is something I've
noticed. Wouldn't have been too much longe and they probably would have
offered a serial port on the actual computer itself. ;)

Sounds about what I was thinking. Similar to the bootup routine
that went with the numerical keypad.

I'm currently hitting the books on keyboard mapping to see what I
can figure out about it. Three of those keys are seen enough to make
the clicking sound.. I just wonder what the computer is seeing. :)

As for BobTerm... the macros are simply awesome!! 21 macro keys and
then a macro setup for use with a JOYSTICK! Hehehe... not bad. I have
it in use when I play LEGEND OF THE RED DRAGON... forward for searching
for another monster, fire button to attack... works great!

I like that "Mostly no one cares." What about the ones that do care? I have around 2000 disks full of software that use to be sold for around $9 per disk (in the day). All of the disks came from Lotsabytes Software. The guy use to sale with a ad in Antic. I bought the software and have been think about putting all of the software on a CD ROM or 2 whatever it takes. A collection like this shouldnt be kept by just one person. I feel I should get this software to everyone that would like it but, getting the okay from all the programmers would be impossible to do. So do I just make the CD(s) and hope nobody ever says anything. And what does one do when the copyright holder says something? Can they sue you? What legal action can they take?

The basic idea is this: Trying to identify, contact, and get
permission from each proper copyright holder for each piece of
software is like you say, really an impossible task. So... let them
come to you! Usually, the only ones that complain are not the
copyright holder (ie other common people who just have to lead a
crusade) anyway. The real copyright holders by enlarge, really don't
give a hoot about these 1 or 2 decade old 8-bit titles.

I sincerely doubt anyone would want to sue you without giving you a
chance to cease and desist first. Also, even if anyone wanted to, it
wouldn't even be practical most likely.

its not that they may or may not care,i agree with you,i have over 20,000 games new in the wrapper in stock that just do not sell because if you watch this news group,and others,there is always someone asking for illegal images,or out right posting of web sites full of illegel images for download for free,it killed my disk bussiness,upon contacting many still in bussiness software companies about this about 2 years ago,i was laughed at,and told that the new stuff is valuable,not the old stuff in most instances,they did not have the time to go after people who were giving/selling stuff that was no longer supported,in other words they could care less, there are people out there who are putting out cd's full of copywrited stuff for emulators right in public with no fear because of the software houses indifference to there own product,we always try to contact whoever owns this stuff to get permission,if we can find them,most just laugh,say i do no care,or scream i do not care,and hang up,we offer a royalty to all,most know that its not worth it,if someone does come forward we offer the royalty,and if thats not enough,we pull it,what you have may be a treasure,was it pd in the first place,if so,its fair game,thanks,
lance

Okay, here's what to do:
Take your allowance money, and go to local thrift stores or flea markets and buy some uncommon-to-rare Atari 2600 cartridges on the cheap. Then, go on eBay and sell the cartridges for a profit. Then, buy Atari 8bit stuff with the profit!!
Or...just go mow some yards!

Care to remind us about these different versions?

I've certainly heard of the different Dig Dug versions (Datasoft vs Atari, probably?), but I don't remember hearing of different versions of Qix.

Currently trying to hook up a numerical keypad to use with my BBS activities, and I have been instructed to "Append the keypad.obj file to the 850 autorun.sys handler."

This involves the copy command on the DOS I've heard, but I was instructed to consult the DOS manual. :) Well not only can I not find my manual after all this time, but I'm using MyDos 4.5 at this time.

Anywho, anyone know this one off hand?

There were two versions of Dig Dug released from Atari on cart format.
One had graphical and gameplay enhancements. The second version of Qix
is noted as Qix Rev. 7

Don't forget the 2 versions of Final Legacy also.

Hope that helps,

Again, That was built into the os. It was easy to redirect to any code
you wanted when the function keys where pressed. Same deal with the
help key

> >
> > I started life with nothing, and still have most of it left...
>

The key presses are IRQ driven. Pokey looks after the keyboard and
interupts the processor only when a key has been pressed.

And we are complaining that a 12 year old would want a Atari?

I'm always curious what 12 years old now days like about the Atari system. More than likely the games. (Since I'm sure it has never been an effective computer for them.) But which games? :)

Doctor Clu

140. Set up an Atari 800XL for email and maybe web

Newsgroup: comp.sys.atari.8bit

Source record: 47562

Hi Guys and Girls,

Go easy on me as my last experience with Atari was as game player many moons ago.

Like a good little newsgroup person I read the FAQ at http://www.faqs.org/faqs/atari-8-bit/faq/ and poked around the webring at http://www.geocities.com/SiliconValley/Lakes/7953/a8ring.html

I'm trying to help out a fellow ham (amateur radio operator) and he would like to "set up" his Atari 800XL to be able to use email and possibly web access through a dial-up account. I know we'll need a "external" modem but other than that I'm not quite clear on hardware needs. He has, I guess, the standard 64K machine with no extra memory and no hard drive attached.
I know he'll eventually need an ISP account also.

The real question I think is what software is available for this platform to enable Internet email and ....web access.

I read a little in Deja News and I think maybe telnet is one way to go, but what client and where can I find it? Maybe also some WinSock for the Atari(ASock?) type program also?

Could someone point me to a web page or email me some help/FAQ files.

I'll read the newsgroup so a personal email, while appreciated, is not necessary(I hate it when folks say they don't have time to read the newsgroup....heck they had time to read it long enough to post their question).

Thanks much,
Greg Miller

141. APE Under Linux Dosemu?

Newsgroup: comp.sys.atari.8bit

Hello,

I was wondering if anyone out there has been able to get APE to work
under Linux dosemu 0.98.8?
It never successfully transfers a whole disk for me, always hangs
sometime in the middle.

Examples of working dosemu.conf, or other tips or tricks would be
appreciated.

Thanks,
Chad

How the hell do you think you are talking to my son that way?! He not trying to scam the computers he would get he would find out info on how they were made, take pics, experiment them so he could post info on it and if anyone had a question he would use it to find out answers. So just Back the hell off.

: Atari(ASock?) type program also?

I don't believe there's any viable PPP stuff for the 8-bit (I've been kinda
out of the scene for a while, though).

What he'll need is an ISP which provides shell access (ie, you connect via
a modem and it's like talking to a BBS... just straight ASCII... or, rather,
VT100).

When he connects to the ISP's dial-up he'll be presented with a login
prompt not unlike what you get when you connect to the server via telnet.

From there, he can run programs like:

"Pine", "ELM," "Mutt," etc. -- Mail readers / composers
"Tin", "Pine", "Trn", etc. -- News readers
"Lynx" -- Web browser

Since all of these programs pretty much require 80 column "smart" terminals
(ie, more than plain ASCII, like, for example, VT100!), he'll need a
modem terminal program that provides this...

Ice-T
FlickerTerm 80

Ice-T is 80 columns in 320x192 graphics mode with 3x6 pixel fonts.

FlickerTerm 80 is 80 columns in a flickered, interlaced 40x24 text mode,
with 4x6 pixel fonts.

I forget what other features each have, but from what I recall, they're
both pretty featureful.

I think newer versions of Ice-T require 128K or more RAM, but there's
an "Atari 800" version which works in, I guess, 48K.

Itay, if you're there, please correct me if I'm wrong. :)

I've never gotten APE or SIO2PC to run under Dosemu, but I did get the
cable to work using a native Linux program. The initial code was
written by someone else, and I modified it to add features.

atari@benjamin.net or bensmith@teleport.com instead of NewsGroups as I
find it hard to keep up with NewsGroups.

NOW! For a limited time offer! Buy an Atari ST Computer and receive,
your choice, for ***FREE*** an ST Color or MonoChrome Monitor. That's
right, you too can have a Color or MonoChrome Monitor, made by Atari
when you buy an Atari ST Computer. Thats an SC1224 or an SM124 Monitor.
Customer pays shipping. While supplies last.

e-mail: atari@benjamin.net

Click for WebSite!

I've added more and will be adding more Hardware, Software, Books and
Accessories for Classic 8 Bit and Atari ST. So checkout what's new on
my WebSite. In Fact, check it regularly as my Catalogs are updated
regularly. Customer's are served, first come, first serve! I have 6
different Catalogs, and my SoftWare Catalogs are my largest. They have
the biggest Byte Count. You should see my inventory! I have TruckLoads
of HardWare, Boxes & Boxes of Software & Libraries of Books & Reference
Material for the Classic Atari 8 Bit & Atari ST! And remember, if you
can't come see me today, come see me tomorrow!

also, if you live in Portland, Oregon, interested in Atari and want to
meet with other Atarians. Read the Ad near the bottom of this message.

FREE Catalogs for Classic Atari 8 Bit & Atari ST Computers! Hard-
Ware, SoftWare, Books & Accessories! View Atari Catalogs on the Web at
http://www.atari.benjamin.net And Jump to my FTP site linked to my Web
Site so you can Download Free Catalogs or FTP directly to my site at:
ftp.teleport.com/vendors/bensmith/ If you can't get Catalogs that way,
Feel free to Request catalogs through E-Mail. Really, it's not an
inconvenience. I do ask that you specify Atari 8 Bit, Atari ST or Both!
Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail.
Please let me know if I can attach text files to your E-Mail. Catalogs
are just regular ASCII text files so you can download them into your
text editor and view them, edit them or print them out! It would make
things easier for me if you take my Catalogs, load them into your text
editor, delete what you don't want and E-Mail me the rest! To expedite
things, include your complete Mailing address so I can figure your
Shipping/Postage & Handling. I'll be back after the weekend.

If you have an Atari and live in Portland, Oregon. U.S.A. or vicinity, you are cordially invited to attend a Meeting of the Portland Atari Club. You don't have to be a member to attend. Now we've moved our meeting to a new night. Same Bat Time! Same Bat Channel! We meet the 2nd Thursday of each Month. Our Next meeting will be Thursday, January 13th, 7 pm at the Pizza Baron at 2604 S.E 122nd Avenue in Portland, Oregon. We're trying to rebuild our club so we're looking for Atarians who wan't to get involved in supporting other Atarians. If your interested, call Ben at (503)256-9974 and by all means, come to our meetings on the 2nd Thursday of the Month. For more info, surf the Web@

http://pac.pdxweb.net

e-mail: atari@benjamin.net

For more information or directions, please call our Vice President Ben Smith at (503)256-9974 See you there!

You should know I regularly add more Atari stock items to my catalogs and this weekend is no exception. A list of my new ST Software I just added to my Catalog are listed below. In case your wondering why my Catalogs (below) are formatted to 38 Columns. They are made to be compatible with the lowest common denominator. Also known as the Atari 8 Bit. Once the Classic Atari User converts the Carriage Returns to Atari 8 Bit.

(grinning at the last statement) Nah... I won't go there. :)

Granted, this particular one is more than likely a scam. But I do find it interesting when 12 year olds do find interest in the 8-bit computer and what is had to offer.

157. About My Donating Computer Stuff Post...

Newsgroup: comp.sys.atari.8bit
Date: 2000-01-06 00:00:00 UTC
From: Andy Luecke <luecke@netnitco.net>
Message-ID: <853ian$e5l$1@hyperion.nitco.com>
Source record: 47579

I had recently posted a message asking if anyone wanted to donate stuff for me to get infp,pics, etc.. to put on my site. It had one comment about me being 12 (It said: "NOTE: Sice i am only 12 i cannot afford shipping.) Than everyone posted a message say i was a scam, a disshonest asshole, and stuff that made me feel like crap. so i would like to thank all of you that posted a reply stating such things; you've made my day more terriblr than the average school day i end up going throuh with kids. I also posted a link to my site, the about me section. For all of you who think i'm a fake,scam,disshonest asshole,etc.. please visit this: http://members.xoom.com/luecke12/aboutme.html

From: Andy Luecke <luecke@netnitco.net>
Message-ID: <853kqd$lr7$1@hyperion.nitco.com>
Source record: 47580

I thought i should add this part too. I thank all of you that did post a message and did not doubt me (very few people though)

Last year I turend 12 in febuary.
than in march i got my computer and my dad got an internet connection. than later on i discovered what newsgroups were all about. July of 1999 I opened up my first web page http://www.mynvo.com/luecke than after starting it i started posting news group messages on news groups like atari,commodore,tandy,etc.. hence how last year i was 12 since my b-day was in febuary...i will be turning 13 on feb. 04. What do I need to do send you my picture and a sign saying im andy luecke?! So you can belive me?? Than I opened my page at http://members.xoom.com/luecke12 and wanted computer stuff so i could get pics,info,etc.. on them to put on their site an if anyone wanted to know anything i could try it and find out. So than I did and got a mess of replys saying I was a scam etc... so than i posted the url for the about me page at http://members.xoom.com/luecke12/aboutme.html

Andy

I suggest you spend a bit more time learning English grammar and spelling
and a bit less time whining because the users in this group are not
prepared to send you "sympathy" computers.

I will enclose my kludged email at the bottom of this post.

No problem, I used the brezenham circle routine for my 'game shell' I hacked up in Pascal for the game I'm developing. I have some units I hacked up that simulate GTIA well enough, and use them to layout the graphics and test algorithims. Then I port the Pascal equivalent (using my GTIA unit) to Test Computer Language or Assembler (depending on the speed I need) for the Atari. I will enclose my kludged email at the bottom of this post.

If you look at the 8051 instruction timings you will find they are fairly horrible too. 12 clock cycles doesnt sound too far from wrong for a fair few. I do remember 58% of all instructions execute in under 1 uS with a 12 Mhz clock on a 80c552. So you can see that 42% must take > 12 clock cycles (blech). I remember being told that phillips had a 16 bit extension to the 8051 architecture that had much better CPI's

> <snip 2k incarnate evil>

;)

I was wondering if Peter Pachla would know about this kinda nasty stuff, I noticed the 'DEC' collection in his signature. Didnt the pdp-8 have some kinda weird page boundary like this. I'm pretty sure it wasnt the DG Nova.

< Details of PIC branching deleted >

The PIC sounds just plain nasty, I think at this point I would be searching the net for any better freeware compilers that will hide this nastiness. I like the sound of your permuter that tried to get things in the best order.

< pascal compiler stuff trashed >
>
> Its pretty Deep Magic to do it well. I've toyed with writing a basic
> compiler, but dealing with the expression trees get a little subtle- and
> thats just the first phase. It might be easier to write a sort-of Lisp
> compiler.

Yeah the time I spent thinking about this has resulted in me using functions
for everything. Sort of like:

```
assign(c,add(a,b); ;c:=a+b
assign(d,mod(add(e,f ),10); ;d:=(e+f) mod 10;
```

I'm very green about this subject though, and would want to read some stuff
before I implemented a compiler. I am fairly sure I could hack up a
compiler, but it sure as hell wouldnt be pretty, and I enjoy learning new
stuff when I can. I enjoy reading about the pioneers. Learning Lisp better
and getting more familiar with recursion in general would be a good start
I was looking at some source that implemented a tiny prolog for Lisp last
night. GNU bison could spit out the parser.

< stuff about visual basic deleted >

That sounds like a cool project to have acomplished. What sort of stuff
were you using it for ?

>

I guess some kind of fast software stack implementation would be the key to
making the whole thing work at a decent rate. Have you played with any Lisp
implementations for the Atari ? If so, how do they stack up ?

I would have loved to have had a 'Lisp programming language' ;) cart if it
had existed for my 800xl, and a 'Forth cart' and even a 'Prolog cart'.
Maybee I'm nuts but I sure miss the days when I could flip on the 800xl and
start pounding away at the keyboard with a short simple program idea,
without having to mess around getting my environment set right or fixing my
project file. The short simple program idea inevitably grew, and hours
later I would be staring at screens of stuff. Having to sit around and wait
for the machine to boot for half a minute seems to take all the fun away. I
had seriously thought about building an EPROM based system like
steve-ciarcia (spelling?) did from byte. One where you just threw your
2764 in and burnt the program ;) Or battery backed up ram like the
australian microbee ;) Hey if a 2764 sounds small my first computer, an
Ohio Scientific Instruments, Challenger 1P had 8 k of 2114s 1024x4 450nS
chips ;) >

Anyway heres my email if you want the brezenham stuff

161. memory in 600xl

Newsgroup: comp.sys.atari.8bit
Date: 2000-01-06 00:00:00 UTC
From: Peter Laing <NOSPAMsnailboy1@earthlink.net>
Message-ID: <fQRc4.1226$zr6.55286@newsread1.prod.itd.earthlink.net>
Source record: 47680

For a real quick and nasty way to find how much memory you have
try turning the machine on and letting it boot to the basic READY prompt.
Then type:

print fre(a)

It returns about 37899 on an 800xl with 40 K visible (16 K hidden), (8 K
hidden by BASIC ROM).

Another quick try would be

?peek(106) this is the ramptop in pages (256 bytes)

If you get 160 pages then you know it's probably had a 64K upgrade done to
it.

Other numbers you might see:
128 = 32K
64 = 16K

Good luck

Source record: 47683

Hi everyone,

Just got off the phone with Bruce over at B&C Computervisions, everything is fine, and no they have NOT gone out of business. The internet hosting service that www.myatari.com uses apparently is having some issues and the hosting service is hoping to have it resolved in the next several days so for right now they are off-line.

If you need to place an order or check the status of an order Bruce said the best thing to do is to call at: 530-295-9270.

Their hours are Tues-Sat 10am - 6pm PDT, closed Sunday & Monday.

Take care...

Curt

That is very cool stuff. I remember a couple demos that used the GTIA
modes pretty well, do you know of any games that did as well? As I
recall, they always seemed underexploited..

<snip 8051 instruction kilo-cycles>

Doesn't the standard 8051 div 12 the clock, so a 12mc clock gives a
1us instruction cycle, then giving a obscenely long mul/div execution
speed? Ugggly...

>
> The PIC sounds just plain nasty, I think at this point I would be searching
> the net for any better freeware compilers that will hide this nastiness. I

The PIC hardware is butt-ugly in many ways. The compiler does a
decent job making the best of a bad situation, but PICs are so
horrible some nasty leaks thru. The PIC's prinicpal advantage is the
low cost of the chips and programming hardware, and to a lesser extent
speed. The native assembly is dreadful, but many people have come up
with 8051 macros which make programming MUCH easier. If I had to
write a big assembly app using native instructions, I think I would go
insane. From an architecture standpoint, the COP8/Z8 devices seem
loads better.

> assign(c,add(a,b); ;c:=a+b
> assign(d,mod(add(e,f),10); ;d:=(e+f) mod 10;

Thats pretty much what I did;

(- (+ A1 B2) 42)

Added the value of cell a1 to that of b2, subtracting 42 from the
result. All math was done as floating point, (the rounding problems
came later...). There were no "variables", as all data was either
taken from or stored to spreadsheet cells. Once the execution
returned from the outermost paren, the final result was stored in the
cell associated with the formula when it was loaded into the solver.
I forget what I did to prevent circular loops... I hope I did

something... ;) I did have a sum operator to add up regions of rows or columns. Execution was precipitated by a call to the solver, which chugged thru all the formulas and sent the new cell values right to the grid. Between executions, the VB program could load/replace formulas.

> night. GNU bison could spit out the parser.

Theres some black magic for you.. lex and yacc. I've read and read, and my mind is thoroughly blown. I understand parts of it, but haven't grokked the overall stuff. Its sort of down on my learning priority list at the moment- I'm in the midst of OpenGL, then comes Xlib, then comes Perl, then comes... too much stuff too little time...

> That sounds like a cool project to have acomplished. What sort of stuff
> were you using it for ?

The app itself was rather prosaic, we wrote it when VB3 was the New Thing. We were writing a system to track construction project costs for field offices of the Dept of Energy. Thus, we needed to support spreadsheets that added rows and columns to get totals. Once we got hold of SpreadVBX, we (happily) threw out my stuff, because it was kind of heinous to deal with. Not so much setting up the formulas, but the standard VB grid control was extremely difficult to manage. Spread had its own problems, but it solved lots of ours. But, the solver was fun to write- and fun to see it actually work.

It was kind of neat to write something that ran as a Windows program (.dll in this case), because before that point, we used Windows principally as a Solitare device driver. (Some might argue its still not useful for much more than that... ;)) But oh, the bugs- Win31 has even worse memory protection than Win95/98, so the first wild pointer would nearly certainly crash Windows. Or an invalid handle passed to the graphics subsystem would blow things up. 95/98 aren't too much better even now, although GDI now practices somewhat better self defence. I hate Windows, can you tell?

> Have you played with any Lisp
> implementations for the Atari ? If so, how do they stack up ?

Atari does have its own Lisp implementation. It was written by a company named "Datamation", and was a derivative of Interlisp (but I don't know what that implies about its design). It looks and acts (still runs too... ;)) like regular Common Lisp with a bunch of stuff missing. On the other hand, it has support for all the Atari graphics ops (plot, draw, graphics modes, setcolor)- and xio calls too. Its pretty short on advanced features, general sequences, structs, formatted output, etc... but all the basic list operations are there. I don't know if it could be put on cart, but as I recall, the binary was bigger than your average cartridge. With mem.sav on floppy, it could run DUP and return, it was quite effective being run as AUTORUN.SYS. Your own little Lisp Machine, don't you know.... ;) I

had a Lisp programming class at school and used it for the
assignments.

> I would have loved to have had a 'Lisp programming language' ;) cart if it
> had existed for my 800xl, and a 'Forth cart' and even a 'Prolog cart'.

I <think> the Atari had Forth, I've no clue about Prolog. It did have
Pascal though- a compiler on 2 floppies. I've an ad for it
somewhere...

> Maybee I'm nuts but I sure miss the days when I could flip on the 800xl and
> start pounding away at the keyboard with a short simple program idea,

> and wait

I still like the Atari Basic's onscreen editing. Nothing surpasses it
except Emacs... ;) (Blood is thicker than water you know)

But you're right about the virtues of a simple environment. There are
tradeoffs, but its nice to just be able to concentrate on just the
program and not have to fuss with development environments and
operating systems and whatnot.

> australian microbee ;) Hey if a 2764 sounds small my first computer, an
> Ohio Scientific Instruments, Challenger 1P had 8 k of 2114s 1024x4 450nS
> chips ;) >

8k is cool- you can do all sorts of stuff in that much space. At one
time, even Microsoft was able to use it. I had occasion to do some
little programs on an Ohio Scientific, I remember liking the keyboard-
and laughing at PEEK and POKE. lol...!

Subject: 1.1) What is an Atari 8-bit computer?

400 800 1200XL 600XL 800XL 65XE 130XE 800XE XE Game System

Here is a very condensed history of Atari, centered around their 8-bit computers.

1972
Atari Inc. is formed by Nolan Bushnell, incorporated on Tuesday, June 27. Atari created the first coin-operated arcade video game with the introduction of Pong. The video game industry was launched and has shaped pop culture ever since.

1976
Warner Communications acquires Atari Inc.

1977
Atari launches the Video Computer System (VCS), later known as the 2600, giving birth to home video game systems.

1978
In December, Atari announces the Atari 400 and 800 personal computers, using the 6502 microprocessor. The Atari 800 was code-named "Colleen"; the 400, "Candy."

The following are most of the team who originally designed the 400/800.
Credit for providing this information for the FAQ goes to:
Doug Neubauer (by way of James Finnegan, mailto:finneganj@delphi.com)
Jerry Jessop, mailto:jjessop@ix3.ix.netcom.com
Scott Emmons, mailto:scotte@center.uscs.com

VLSI HARDWARE:
Jay Miner - Creator and System architect, VSLI manager
Steve Mayer - Also one of the creators - Partner in "Cyan Engineering"
Lawrence D. Emmons - Also one of the creators - Partner in "Cyan Engineering"
Joe Decuir - ANTIC and system and creator
???A French guy - ANTIC logic designer
George McLeod - CTIA and GTIA logic design
Doug Neubauer - POKEY logic design
Mark Shieu - POKEY chip design

Steve Stone - POKEY layout design
Steve Smith - Technician for ANTIC and GTIA
Delwin Pearson - Technician for POKEY

OS PROGRAMMERS:
Larry Kaplan
David Crane
Bob Whitehead
Al Miller

1979
The Atari 400 and Atari 800 Home Computers debut at the Winter Consumer Electronics Show (CES) in early January.

Jerry Jessop, mailto:jjessop1@home.com writes:
"The first official small shipment of the 400/800 was on August 29th 1979. These were hand built pilot run units to Sears that needed to be in stock by Sept. 1 so they could be placed in the big fall catalog. The units were placed in the Sears warehouse and then immediatly returned to Atari after the "in stock" requirment had been meet.

The first "real" consumer units were shipped in Nov. of 79 and were 400's to Sears followed very shortly by 800's."

These MOS Technology 6502-based systems run at a clock speed of 1.79 MHz, offering 128 colors displayable simultaneously, up to 320x192 graphics resolution and up to 40x24 text resolution in 8 graphics modes and 6 text modes. Video may be displayed either on a composite video monitor in the case of the 800, or on a standard television for both systems. 4 independent sound voices are available through the audio output of the television or monitor, each with a 3 1/2 octave range, plus there is a built-in speaker for key-click and other programmable sounds. The 800 has a second cartridge port and a full-stroke keyboard, while the 400 has a single cartridge port and a membrane keyboard. Each has 4 serial controller ports and an Atari Serial Input/Output port. Originally, both the 400 and 800 were sold with 8K RAM, but later most 800's were sold with 48K and 400's with 16K. Each includes the 10K Atari Operating System in ROM.

The 800 can be fitted with 1-3 of the following two RAM modules:
CX852 8K RAM module, CX853 16K RAM module
and must be fitted with a ROM module:
CX801 10K ROM, CX801-P 10K ROM for PAL machines

[WHEN WAS THE 400/800 REVISION B OS INTRODUCED????]

1981
November: 400/800's begin shipping with the new GTIA chip in place of CTIA, increasing the palette of simultaneously displayable colors to 256 and adding 3 new graphics modes. CTIA is totally phased out by the end of the year.

Jerry Jessop, mailto:jjessop1@home.com adds:
"The very first proto systems did have the GTIA, but it had some problems and was not released in the consumer version until 1981. The

GTIA was completed before the CTIA."

1982
The introduction of the 1200XL in late 1982 marks the single largest advance in the 8-bit Atari system. The 1200XL runs most software and hardware designed for the 800 and 400, but now runs a slightly more advanced 6502C microprocessor, and includes a full 64K RAM. The single cartridge and monitor ports remain, along with 2 controller ports. In addition, the 1200XL includes 4 programmable Function keys and a Help key, built-in diagnostic and graphics demonstration programs, and probably the favorite keyboard of any 8-bit Atari computer. Clicks previously outputted through the built-in speaker are now heard from the television or monitor's speaker. The revised 16K Operating System offers many new features, including an alternate International Character Set.

1983
In 1983 Atari replaced the 1200XL/800/400 line-up with the new 800XL and 600XL. These new machines include most of the features of the 1200XL minus the Function keys and the demo program. But now both the 800XL and 600XL have the Atari BASIC language built-in. In addition, these two systems offer the Parallel Buss Interface (PBI), providing fast parallel access to the heart of the computer. The 800XL contains 64K RAM while the 600XL has 16K RAM.

The 600XL can be expanded from 16K to 64K with the 1064 Atari Memory Module.

1984
Warner Communications sells Consumer Electronics and Home Computer divisions of Atari Inc. to Tramiel Technologies on Monday, July 2.

Atari Corporation is formed by Tramiel Technologies and its products marketed under the Atari brand.

(
Atari Games Corporation is also formed from the former coin-op division and markets coin-op games under the Atari Games brand.

Atari Games Corporation is a developer, marketer, licensor and publisher of coin-operated video games, having created such classics as Pong, Asteroids, Centipede, Missile Command, Gauntlet, Area 51, and San Francisco Rush Extreme Racing. Atari Games Corporation is a subsidiary of Midway Games Inc. (NYSE:MWY). The Atari Games home page is at http://www.atarigames.com.
)

1985
The new Atari Corp. delivered on its promise to advance the 8-bit Atari system by replacing the 800XL/600XL with the new 130XE and 65XE in 1985. The 65XE is nearly identical to the 800XL in features, minus the PBI. The 130XE, however, offers 128K RAM, plus the FREDDY chip, supporting the unique (but rarely used) ability for the 6502C and the ANTIC to independently access RAM banks. In addition, the 130XE replaces the PBI port with the Enhanced Cartridge Interface (ECI), continuing the powerful feature of a fast parallel port. European 65XE's include the ECI port.

Only by the final production run of the 130XE (when was this???) was the XL/XE OS revised to include a "keyboard test mode" that matched the XE keyboard, and a RAM test that tests the full 128K of RAM.

1987
In a change of marketing strategy, Atari introduced the new XE Game System in 1987. Despite its label, the XEGS is a true 8-bit Atari computer system. It offers the convenience of a detachable keyboard and built-in Missile Command game (hold down Select at startup), while offering 64K RAM and full compatibility with the 65XE.

The 800XE, a 130XE with just 64K, was released at some point in eastern Europe. [WHEN???]

1992
Atari officially dropped all remaining support of their 8-bit computer line on January 1, 1992.

1996
On July 31, 1996, Atari Corp. became a JTS subsidiary. JTS Corp., with headquarters in San Jose, Calif., was founded in 1994 to design, manufacture and supply enhanced-capacity hard disk drives for the notebook and desktop personal computer markets.

1998
On February 23, 1998, JTS sold its Atari Division to HIACXI Corp., a wholly-owned subsidiary of Hasbro Interactive, Inc., which is a subsidiary of Hasbro, Inc., for $5 million in cash.

1999
Hasbro is a worldwide leader in the design, manufacture and marketing of toys, games, interactive software, puzzles and infant products. Both internationally and in the U.S., its Playskool, Kenner, Tonka, OddzOn, Super Soaker, Milton Bradley, Parker Brothers, Tiger, Galoob and Hasbro Interactive products, provide children and families with the highest quality and most recognizable toys and games in the world.

Hasbro Interactive, Inc. is a leading all-family interactive games publisher, formed in 1995 to bring to life on the computer the deep library of toy and board games of parent company, Hasbro, Inc. Hasbro Interactive has expanded its charter to include original and licensed games for the PC, the PlayStation and Nintendo 64 game consoles and for multi-player gaming over the Internet. Headquartered in Beverly, Massachusetts, Hasbro Interactive has offices in the U.K., France, Germany, Japan and Canada. For additional information, visit Hasbro Interactive's web site at: http://www.hasbro-interactive.com .

Atari Interactive, Inc. is a Hasbro affiliate, online at http://www.atari.com/

Atari currently (12/99) markets:
Atari Arcade
Centipede
Frogger
Glover

H.E.D.Z. - Head Extreme Destruction Zone
Missle Command
Nerf ArenaBlast
The Next Tetris
Pong
Q*Bert

Subject: 1.2) What can I do with an 8-bit Atari?

What can you do with an 8-bit Atari computer system? Virtually anything you can do with any other type of computer!

Programming? Pascal, C, BASIC, Logo, Pilot, Forth, Lisp, 6502 assembler... Plus powerful unique languages like Action! and QUICK...

Word Processing? Try AtariWriter, Letter Perfect, Paperclip, TextPro, Bank Street Writer, 1st EXLent, TurboWord, Cut & Paste, Letter Wizard, Panther, Superscript...

Database? Try TurboBase, TurboFile, Synfile, Data Perfect, MicroFiler, MegaFiler, Homebase, Super Data Base 1-2-3, Small Business System...

Speadsheet? Look at Syncalc, Visicalc, TurboBase, Calc Magic, Turbo-Calc, SAM Budget...

Communications? There's Express!, BobTerm, Kermit-65, Omnicom, VT850, Chameleon, Ice-T, FlickerTerm 80, Term80...

Graphics? Print Shop, Newsroom, Blazing Paddles, Video Title Shop, Virtuoso, Movie Maker, News Station, Publishing Pro, Awardware, Page Designer, ChromaCAD, Rambrandt...

Music? Virtuoso, Music Studio, Music Construction Set, Songwriter, Electronic Drummer, Music Painter, Music Composer, AtariMusic, MIDI-Track, Digital Music System, Chaos Music Composer... The ATARI 8-bit could also be made to speak using SAM (Software Automated Mouth) by Don't Ask Software. It can speak without the use of any hardware modification.

Alternate Operating Systems? There's the Diamond Graphic Operating System; SpartaDOS X, the 64K DOS on a "supercartridge"; the S.A.M. (Screen Aided Management) 80 column Desktop System; the Ultra Speed Plus OS; the TurBoss! High Speed O/S...

Hardware? A plethora of upgrades and add-ons are available, realizing improvements in speed, memory, sound, graphics, storage media...you name it!

Education? Colorful graphics, exciting sounds and full-screen editing give rise to hundreds of quality educational software titles.

Entertainment? The 8-bit Atari has long been famous for thousands of great games.

If you want to do something with a computer, chances are you can do it on an 8-bit Atari computer. While slower than today's PC's, the 8-bit Atari is far less costly than any of these, is easier to program at the machine level or alter at the hardware level, and has been documented more thoroughly than any of the newer computing platforms. The relative simplicity in design of the 8-bit Atari also means that many people find the systems more reliable than their modern counterparts.

The software for the 8-bit Atari is sometimes more powerful than on any other platform. For example, some Bulliten Board Systems are still run on 8-bit Ataris specifically because the BBS software available can be better than that for any other type of computer. There is a reason for the relative quality of software on the 8-bit Atari. People program commercially for the latest PC's to make money; people program the 8-bit Atari because they want to -- they enjoy producing good software. It takes a team of specialized programmers to develop a major piece of software for those other systems; with the 8-bit Atari, a single person has the chance to learn the entire system, thereby developing greater pride in his programming abilities and his final product. The character of the programmer can shine through.

The 8-bit Atari owner can take pride that his/her computer platform was developed years before the IBM PC or Apple Macintosh were even on the drawing boards, but remains as useful today as it was in 1979.

For these reasons and more, the 8-bit Atari remains a popular alternative in today's home computer marketplace.

Subject: 1.3) What are the some of the performance features of the 8-bit Atari?

Some of this text by mailto:bill@newbreedsoftware.com (Bill Kendrick).

CLOCK SPEED:
NTSC machines: 1.7897725 MHz
PAL machines: 1.773447 MHz

SCREEN REFRESH RATE:
59.94 times per second (Hz) on NTSC Ataris
49.86 Hz on PAL machines

ANTIC AND THE DISPLAY LIST:

ANTIC Mode #	CIO/BASIC Graphics #	Type	Display Resolution (full screen)	Number of Colors
2	0	Char	40 x 24	1 *
3	-	Char	40 x 19	1 *
4	12	++ Char	40 x 24	5
5	13	++ Char	40 x 12	5
6	1	Char	20 x 24	5
7	2	Char	20 x 12	5
8	3	Map	40 x 24	4
9	4	Map	80 x 48	2
A	5	Map	80 x 48	4

```
B 6 Map 160 x 96 2
C 14 ++ Map 160 x 192 2
D 7 Map 160 x 96 4
E 15 ++ Map 160 x 192 4
F 8 Map 320 x 192 1 *
F 9 + Map 80 x 192 1 **
F 10 + Map 80 x 192 9
F 11 + Map 80 x 192 16 ***
* 1 Hue; 2 Luminances
** 1 Hue; 16 Luminances
*** 16 Hues; 1 Luminance
+ require the GTIA chip. 1979-1981 400/800's shipped with CTIA
++ Not available via the BASIC GRAPHICS command in 400/800's.
```

GRAPHICS INDIRECTION (COLOR REGISTERS AND CHARACTER SETS):
Nine color registers are available. Each color register holds any of 16 luminances x 16 hues = 256 colors. (Four registers are for player-missile graphics.

Character sets of 128 8x8 characters, each with a normal and an inverse video incarnation, are totally redefinable.

PLAYER-MISSLE GRAPHICS:
Four 8-bit wide, 128 or 256 byte high single color players, and four 2-bit wide, 128 or 256 byte high single color missiles are available. A mode to combine the 4 missiles into a 5th 8-bit wide player is also available, as is a mode to XOR colors or blacken out colors when players overlap (good for making three colors out of two players!) Players and missiles have adjustable priority and collision detection.

DISPLAY LIST INTERRUPTS (DLI's):
Screen modes can be mixed (by lines) down the screen using the Display List - a program which is executed by the ANTIC graphics chip every screen refresh:

All other screen attributes (color, player/missile horizontal position, screen width, player/missile/playfield priority, etc.) can be ajusted at any point down the screen via DLI's.

SCROLLING:
Fine scrolling (both vertical and horizontal) can be enabled on any line on the screen.

SOUND:
Four voices of 8-bit pitch-resolution, 4-bit volume-resolution, 8-distortion sound can be produced. 2 voices (1 and 2, and/or 3 and 4) can be combined to make 16-bit pitch-resolution. Also 4-bit volume-only modes can be enabled for digitally sampled sound replay.

A fifth "voice" is produced by the internal speaker on Atari 400/800's (for keyclick and buzzer) and in the XL's and XE's this was (fortunately!) rerouted through the normal audio output, and the keyclick can be disabled.

Subject: 1.4) What is the internal layout of the 8-bit Atari?

The following four paragraphs were written by Chris Crawford and appear in De Re Atari (Atari#APX-90008), a book published and copyright by Atari, Inc., 1981-1982. The text been very slightly modified here for generality.

"The internal layout of the Atari 8-bit computer is very different from other systems. It of course has a microprocessor (a 6502), RAM, ROM, and a (PIA). However, it also has three special-purpose (LSI) chips known as ANTIC, GTIA, and POKEY. These chips were designed by Atari engineers primarily to take much of the burden of housekeeping off of the 6502, thereby freeing the 6502 to concentrate on computations. While they were at it, they designed a great deal of power into these chips. Each of these chips is almost as big (in terms of silicon area) as a 6502, so the three of them together provide a tremendous amount of power. Mastering the Atari 8-bit computers is primarily a matter of mastering these three chips.

ANTIC ("Alpha-Numeric Television Interface Circuit") is a microprocessor dedicated to the television display. It is a true microprocessor; it has an instruction set, a program (called the display list), and data. The display list and the display data are written into RAM by the 6502. ANTIC retrieves this information from RAM using direct memory access (DMA). It processes the higher level instructions in the display list and translates these instructions into a real-time stream of simple instructions to GTIA.

CTIA ("Color Television Interface Adapter") / GTIA ("George's Television Interface Adapter") is a television interface chip. ANTIC directly controls most of GTIA's operations, but the 6502 can be programmed to intercede and control some or all of GTIA's functions. GTIA converts the digital commands from ANTIC (or the 6502) into the signal that goes to the television. GTIA also adds some factors of its own, such as color values, player-missle graphics, and collision detection.

POKEY (means "POT and KEY" as in the paddles and keyboard) is a digital input/output (I/O) chip. It handles such disparate tasks as the serial I/O bus, audio generation, keyboard scan, and random number generation. It also digitizes the resistive paddle inputs and controls maskable interrupt (IRQ) requests from peripherals.

All four of these LSI chips function simultaneously. Careful separation of their functions in the design phase has minimized conflicts between the chips. The only hardware level conflict between any two chips in the system occurs when ANTIC needs to use the address and data buses to fetch its display information. To do this, it halts the 6502 and takes control of the buses."

While the 400/800 models contain a generic 6502 CPU, all of the XL/XE models contain Atari's customized 6502C chip. Alan Manuel K. Gloria, mailto:mani@pworld.net.ph writes:

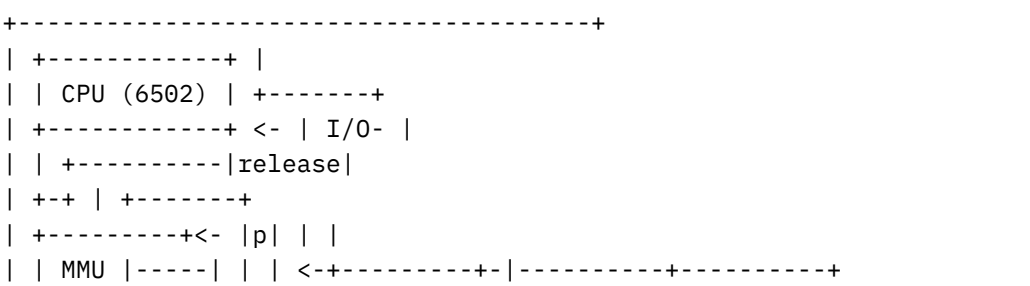
The difference goes something like this: On the Atari, there are two microprocessors, ANTIC and the 6502 or 6502c. To allow them to coexist, ANTIC must shut off the 6502/6502c, a process called DMA. The 6502 supports DMA, but in Atari's implementation, it required 4 chips. The 6502c has this additional circuitry built-in.

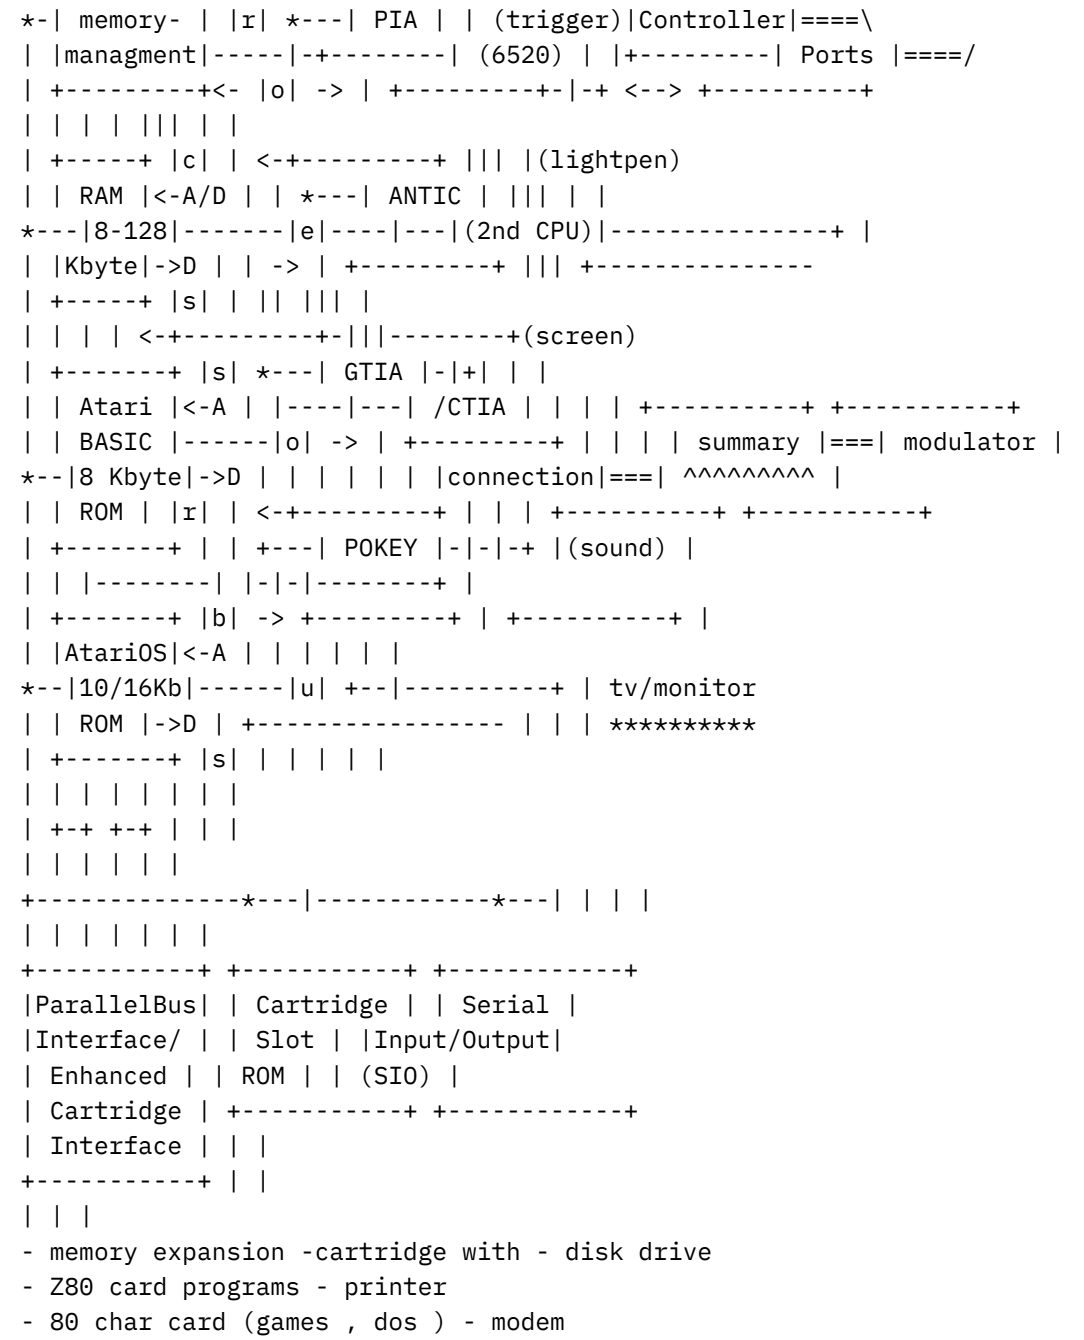
More on this from James Bradford, mailto:sup8pdct@mail.cth.com.au :
The 6502c in all PAL atari's, late 400/800, XL, XE NTSC atari's have a special 6502. This 6502 has an extra line called HALT. It is controlled by ANTIC which it uses whenever it needs the data/address bus. The HALT line is on pin 35 of the atari 6502 and must be pulled high for the chip to work (I think) . Early 400/800 NTSC atari's used a standard 6502 and a couple of chips to stop the processor when antic needed the busses

The 130XE and XEGS contain a small additional LSI called FREDDY, a RAM address multiplexer. According to mailto:sup8pdct@mail.cth.com.au (James Bradford), "FREDDY is a type of memory controller. It takes the address and clock from the CPU and multiplexes it with the appropriate timings and signals to use DYNAMIC memory. FREDDY also buffers the system clock crystal and divides it down then feeds that to GTIA. The XEGS has a FREDDY but it doesn't have the extended RAM. Even if it did, you would still need the chip that does the REAL bank switching. It is a small 16-pin chip (Atari/Best Electronics catalog number CO25953: rev9/page 42). It gets RAS from FREDDY, the bank select bits from PIA, A14, A15 and the 6502 halt signal to control which bank of 8 chips RAS goes to. A14 and A15 then go to FREDDY for the address range of the extra memory bank (or normal address range with no bank switching). The ANTIC/6502 select bits in combination with the 6502 halt line, control the switching of the PIA bank number bits to A14/A15 and which bank of memory RAS goes to. Why people say FREDDY does the bank switching is beyond me. An 800XL can look like a 130XE with that 16-pin chip installed (That's right NO FREDDY) and an extra 8 RAM chips."

And more recently James Bradford has written:
Freddy is just a memory decoder and timer. It replaces several chips in the 800xl The small chip near freddy does all the bank selection. CO25953. One line from freddy , Ras (or is it cas?) goes to this chip, Halt and the bank /processor select lines go into this same chip and ras (cas?) comes out. a pin for each bank. If i remember correctly, refresh also goes into this small chip. It would be quite easy to make an 800xl work just like a 130xe with this chip since Ras (Cas?) is required by ALL dynamic ram.

Hardware Arrangement (With thanks to mailto:twh@bigfoot.de (Thomas Havemeister))





- memory expansion -cartridge with - disk drive
- Z80 card programs - printer
- 80 char card (games , dos) - modem

NOTES
* RAM: 400/800: 8K, 16K or 48K standard
600XL:16K standard
1200XL/800XL/65XE/800XE/XEGS: 64K standard
130XE:128K standard
* ROM: 400/800:10K OS, 1200XL:16K OS, all others:16K OS + 8K Atari BASIC
* CPU: 400/800:6502, all others:6502C
* 800 includes two Cartridge Slots, all others include one
* early release 400/800 have CTIA instead of GTIA
* 400/800 have 4 Controller Ports, all others have 2
* PBI is on 600XL/800XL only

* ECI is on 130XE/800XE only

Technical data and schematics for the Antic, GTIA, and POKEY chips are available on Curt Vendel's web site, thanks to permission from Hasbro's Atari Interactive Divisions release of this data. See: http://www.atari-history.com/articles.html

---

Subject: 1.5) How did Atari get it's name?

Graham Thornton, mailto:dangermouse@prodigy.nospam.net types:

This article was published in "I/O - The Magazine of the Atari Home Computer Club" in issue 3 - Summer 1983. The magazine was the official mouthpiece of Atari UK. The article was not attributed to any one person. The words are thiers, not mine.

How Atari Got It's Name

The name Atari actually comes from Japan. And yet the company is most definitely American. Every wondered why? It's an interesting story and one well worth telling.

In 1972 three friends decided to invent and market the first commercially feasible video game. They were Nolan Bushnell, Ted Dabney and Larry Bryan.

To become a partner each man had to submit $100 to the project - a remarkably small sum when you consider the company's success! The next step was to find a name.

Drinking beer and thumbing through the dictionary one day, the three friends came across an interesting entry under "S". The word was Syzygy, or "the straight-line configuration between three celestial bodies". What a perfect name they thought, for three such astronomically talented people!

Now they could get on with the business of inventing games. Their first, Computer Space, was produced and all seemed to be going well.

But then things started to get a little shaky. Larry Bryan decided not to ante up his $100 and pulled out, leaving Bushnell and Dabney to go it alone.

The set up a shop in Santa Clara, California, and incorporated the business. A little later they invented Pong(r).

Busnell and Dabney applied for the name Syzygy to the Office of the California Secretary of State, which regulates Californian corporations, but were told that they were too late. The name was already taken.

Following unsuccessful attempts to buy the rights to the name from the first Syzygy corporation, which appeared to be inactive, the friends' solicitor pressed them to think up an alternative.

This proved difficult. BD Inc and DB Inc were tested and then rejected in turn: the first bore too close a resemblance to Black & Decker, the second to Dunn and Bradstreet.

Inspiration occurred at last, once again in an informal atmosphere. Bushnell and Dabney were both keen players of Go, a Japanese strategy game, and their best brainstorming always occurred over a good game and a bottle of beer.

This time, they decided to make a list of several Go words to see if one of them would fly as the new corporate name.

First choice was "Sente", which means "the upper hand" - something that greatly appealed. Second and third choices were "Atari", which has a similar meaning to the English word "check", and "Hanne", an acknowledgement of an over-taking move.

Busnell and Dabney submitted the list once again to the Office of the Californian Secretary of State, which approved "Atari". The rest is history.

When the company name changed, Bushnell and Dabney decided to update the logo too. They incorporated the "S" from Syzygy and the "A" from Atari into the new design.

It was not until later, as the company became increasingly successful, that an advertising agency designed the slicker and now famous Atari logo - the "fuji" or stylised "A" design.

Subject: 2.1) What is comp.sys.atari.8bit?

news:comp.sys.atari.8bit is the unmoderated Usenet newsgroup for discussion about the Atari 8-bit family of computers, including the 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, 800XE and the XE Game System!

comp.sys.atari.8bit was born around 1986-87 when the earlier comp.sys.atari newsgroup was split into comp.sys.atari.8bit and comp.sys.atari.st.

Large binary posts do not belong in unmoderated discussion groups like comp.sys.atari.8bit. If you wish to share PD/freeware/shareware, use alt.binaries.atari and alt.binaries.atari.d or upload the software to the University of Michigan Atari Archive.

To the best of my knowledge, there is no charter for comp.sys.atari.8bit, presumably because the custom of drafting charters for new newsgroups did not exist at that time.

Subject: 2.2) What other Usenet newsgroups cover the 8-bit Atari?

news:comp.sys.atari.advocacy
Attacking and defending Atari computers. Unmoderated.

news:comp.sys.atari.announce
Announcements of Atari-related hardware and software, Web sites and other
Internet resources, and events
Moderated by Kevin Savetz, mailto:savetz@northcoast.com
Archived at http://www.savetz.com/csaa/

news:comp.sys.atari.programmer
Programming on the Atari computer. Unmoderated.

news:rec.games.video.classic
Orphan home video game systems. Unmoderated.

news:comp.emulators.misc
Emulating one kind of computer on another. Unmoderated.

news:comp.emulators.announce
Announcements related to computer emulators.
Moderated by Qualcomm, mailto:emulators-request@qualcomm.com

news:alt.binaries.atari
uuencoded software for Atari computers. Unmoderated.

news:alt.binaries.atari.d
Descriptions/discussions on software posted on alt.binaries.atari. Unmoderated.

news:alt.binaries.comp.atari8bit
uuencoded software just for the 8-bit Atari. Not widely available.

Subject: 3.3) What is ATARIPL?

From: Wojciech Hartman <harti@waw.pdi.net>
Date: Saturday, March 15, 1997 3:51 AM

I am proud to announce that there is a mailing list "ataripl" for all
polish-speaking Atari users and enthusiasts.

To subscribe the lists you have to send an email to
mailto:majordomo@piwo.bl.pg.gda.pl containing a line "subscribe ataripl".

Subject: 3.4) What is ATARI8-L?

maciej grzeszczuk, mailto:krap@zwieracz.ideefixe.nom.pl writes:

i'd like to invite all of you to atari8-l mailing list.

it's probably the biggest atari 8 bit related mailing list in the world -
- connected bidirectionally to old list at MARIST, and gatewayed to the
FidoNet(tm) international ATARI8-L echo.

for now it has about a 100 subscribers, from all around the world. the list
is free from all the F/S messages, and other off-topic discussions, so
you can find there pure atari8 related stuff... all the messages comes right
to your email account, so there is no need to contact a newsserver, there

is no old-messages deleting, and so on... my wish is that every atari user would be subscribed, so the atari community stay together and grow in strenght.

to subscribe, please send the message to majordomo@zwieracz.ideefixe.nom.pl with the following line in the body (not the subject) of your message:

subscribe atari8-l

the language we use is, of course, english. the list is fast, reliable, regularly maintained.

there is also mail2news gateway that translates all postings on the list to easy to read usenet articles, available read-only to everyone at: news://zwieracz.ideefixe.nom.pl/listserv.atari8-l

the atari8-l mailing list is available as well as a newsgroup listserv.atari8-l on public newsserver zwieracz.ideefixe.nom.pl .

there is also archive of all postings that appeared on the list (well, in fact almost all - about first hundred is missing).

(There's an old list called INFO-ATARI8 which is actually still alive. But knowing about it is no longer necessary, as 100% of its postings are cross-posted with atari8-l.)

Subject: 3.5) What is ATARI8PL-L?

any atari 8bit related threads are welcome. Polish language only.

to subscribe, please mail a message to mailto:majordomo@zwieracz.ideefixe.nom.pl

containing a line:

subscribe atari8pl-l <mailing address you'd like to receive the list to>

in the body (not the subject) of your message

if you get any problems, please report to maciej grzeszczuk, mailto:krap@zwieracz.ideefixe.nom.pl

---

Subject: 4.0) What is XL Search?

XL Search is a new and growing search engine created and maintained by mailto:bill@newbreedsoftware.com (Bill Kendrick), designed to provide much-improved access to the various PD/freeware/shareware Atari 8-bit software archives available on the Internet.

XL Search is located at: http://www.newbreedsoftware.com/xlsearch/

You can also access XL Search via e-mail! Send a blank e-mail to:
mailto:xlsearch@newbreedsoftware.com

XL Search now contains an index of 7 sites, totalling over 17,000 Atari
8-bit programs and files!

(By the way, the UMich site is also indexed at http://shareware.com/.)

Subject: 4.1) What is the University of Michigan Archive?

The University of Michigan (UMich) Software Archives hold a huge number of
files for many computing platforms, including the Atari 8-bit computers. For
more information:

Bill Kendrick, mailto:bill@newbreedsoftware.com (8-bit Atari files)
Mickey Boyd, mailto:boydm@atari.archive.umich.edu (the entire Atari Archive)
Michael Dautermann, mailto:myke@umich.edu (the entire UMich Software Archives)

Downloading

There are numerous methods available for downloading files from the UMich
Archive. The Archivists request you use these mechanisms in this order of
preference:

1) The number one way to get into the UMich archives is via AFS. If you have
AFS, all our files are kept in the directory
"/afs/umich.edu/group/itd/archive". If you have AFS, PLEASE USE IT!
Specifically, use:

file:///afs/umich.edu/group/itd/archive/atari/8bit/

2) Gophering to gopher.archive.umich.edu and looking under the "Software
Archives" choice. Specifically, use:

gopher://gopher.archive.umich.edu:7055/11/atari/8bit/

There are also mirror Gopher servers:
gopher://wuarchive.wustl.edu:70/11/systems/atari/umich.edu/8bit/
gopher://sunsite.doc.ic.ac.uk:70/1/0-Most-Packages/atari/umich/8bit/

3) The WWW interface is fine, at this point. http://www.umich.edu/~archive/
Specifically, use:

http://www.umich.edu/~archive/atari/8bit/

Mirror web sites:
http://sunsite.doc.ic.ac.uk/computing/systems/atari/umich/8bit/
http://wuarchive.wustl.edu/systems/atari/umich.edu/8bit/

4) FTPing to atari.archive.umich.edu and looking in the "8bit" subdirectory.
Specifically, use:

ftp://atari.archive.umich.edu/atari/8bit/

The atari.archive.umich.edu FTP site is chronically overloaded, but there are several mirror sites which are all updated from the home site regularly:
ftp://wuarchive.wustl.edu/systems/atari/umich.edu/8bit/
ftp://sunsite.doc.ic.ac.uk/computing/systems/atari/umich/8bit/
ftp://info2.rus.uni-stuttgart.de/afs/umich.edu/group/itd/archive/atari/8bit/
ftp://barnone.citi.umich.edu/atari/8bit/
ftp://ftp.kendall.mdcc.edu/pub/atari/umich.edu/8bit/
ftp://pmftp.cs.vu.nl/pub/atari8bit/

Brief FTP tips:
- user name is "anonymous"; password is your e-mail address
- Remember to set file type to BINARY when downloading non-text files (.arc, .com, .dcm, etc.) by FTP.

5) E-Mail <-> FTP gateways. See the section of this FAQ list entitled "How do I access Usenet, FTP, Gopher, and WWW by e-mail?

Uploading

Bill writes:
If you're lucky enough to get into this archive via FTP, please upload (with the appropriate translation ("ASCII" for text files, "BINARY" otherwise)) your additions into the "New/" directory.

If you can only access this archive via Gopher, the Web or some other uni-directional way, please e-mail additions to:

mailto:bill@newbreedsoftware.com

Please encode your files with UUencode or MIME ("base 64").

Always remember to upload a ".blurb" file to describe what you've uploaded. And if there's a specific place you think the file should go, please mention it in the ".blurb" and/or in an e-mail to me.

Please keep your ".blurbs" short, however. (1/2K or less!)
If you have text documents for the program, include them in an ARC file with the program, or send them seperately as a ".TXT" file.

Thanks!

Subject: 4.3) What is the PVV Archive?

This is a mid-sized Atari FTP site maintained by mailto:eyvind@stud.unit.no (Eyvind Bernhardsen). PVV stands for ProgramVareVerstedet, or The Software Workshop, a student society at the University of Trondheim, Norway.

ftp://ftp.pvv.unit.no/pub/atari/8bit/ (129.241.210.232)

Uploads go to /incoming/atari/8bit; Eyvind will move them to the appropriate directory. Please include a readme file with each upload, so people know what they're downloading.

Subject: 4.4) What is the ClarkNet Archive?

A mirror of Kevin Atkinson;s ClarkNet Archive, kept by Jason Duerstock:
ftp://ftp.kendall.mdcc.edu/pub/atari/clark.net/ (147.70.146.36)

Subject: 4.5) What is the Gatekeeper's Archive?

This small FTP site offers most of the resources provided on the Atari
8-Bit Home Page. Kept by mailto:ipoorten@cs.vu.nl (Ivo van Poorten, The
Gatekeeper).

ftp://ftp.cs.vu.nl/pub/ipoorten/atari.8bit (192.31.231.43)

Subject: 4.6) What is the Polish Demo Archive?

It's a place when you can get all Polish (not only) demos (not only)
on a Atari 8-bit.
If You have any comments, write to:
mailto:LukSoft@hipokrates.am.lublin.pl

ftp://hipokrates.am.lublin.pl/sys/pub/atari8/

Subject: 4.7) What is the Atari 8bit FTP Archive in Slovakia?

This FTP site contains demos, games, utilities, zines and other useful stuff
from all the world. Also, you can download big amount of slovak and czech
programs for 8bit Atari only from this archive. And finally, because this
site is created and supported by slovak computer group GMG, most of our
products can be found right here.

If you want to place here your program, just send it to me (with some
comment) by e-mail and I will do the rest.

If you have some problems or questions, please contact me at this address:

mailto:mchorvat@econ.umb.sk (Marek Augustin Chorvat)

ftp://svs.scsss.sk/pub/atari

Subject: 5.1) What is the National Capital FreeNet Atari Users SIG?

Internet access to the National Capital FreeNet (Ottawa, Ontario, Canada):

telnet://telnet.ncf.carleton.ca (Type "go atari" at any menu) or
gopher://gopher.ncf.carleton.ca or
http://www.ncf.carleton.ca/

Contact:
mailto:ac382@freenet.carleton.ca (Jack Kitowicz) or
mailto:aa728@freenet.carleton.ca (Blair Dea)

Subject: 5.2) What is the Victoria Telecommunity Network Atari Users SIG?

Internet access to the Victoria Telecommunity Network (Victoria, British Columbia, Canada):

telnet://freenet.victoria.bc.ca (Type "go atari" at any menu)

Contact:
mailto:ua558@freenet.victoria.bc.ca (Gordon Hooper) or
mailto:ud264@freenet.victoria.bc.ca (Ted Skrecky)

Subject: 6.1) What is FidoNet?

[We're not quite sure of the source of the following two paragraphs, but they may have been orginally written by Alan Sharkis.]

FidoNet is a system not unlike the Internet in that it consists of BBSs linked together. Each discussion group (there are nearly a thousand) may or may not be carried by an individual BBS as the sysop chooses. Discussion groups are called echoes, and each echo must be moderated. There is an Atari National Echo which is 8-bit, and several (I believe) ST echoes. BBSs are also free to have local discussion groups that may or may not be echoed nationally.

To access FidoNet, you need to find a FidoNet BBS that carries the echo or echoes you wish to read, and then abide by the rules of both that BBS and the echo. Some of these BBSs require annual membership fees. Some are supported by voluntary donations. One such that can also be reached by telnet is Doc's Place BBS. I'm not even sure of its location, but I think it's Clearwater, FL. If you're coming in via an ordinary ISP and either Netscape or IE, you simply type:

telnet://bbs.docsplace.org

mailto:krap@zwieracz.ideefixe.nom.pl (maciej grzeszczuk) adds:

all fidonet backbone echoes are carried by zwieracz.ideefixe.nom.pl, and they are available read-only via any newsreader. zwieracz itself (2:480/70, 2:48/70, 2:48/700, 2:2/3009) is the main polish fidonet-internet gateway. i gateway many usenet groups onto fidonet echoamil bidirectionally, so fidonet users here in poland can easily read and post articles. this group is also available at my system via EMSI over TCP or standard modem dial-up connection (emsi over tcp ports are 60177 - for telnet, and 60179 for raw socket).

try url: news://zwieracz.ideefixe.nom.pl/fido.atari and you'll reach national ATARI group.

Subject: 7.1) What is the Atari 8-bit Computer Web Ring?

A WebRing is a set of web pages that have been linked to each other. Basically the first page in the ring has a link to the second one, the second one to the

third, the third to the fourth... with the last page linking back to the first. This is all done by adding a small piece of HTML code to your page, which will automatically keep track of where your page lies in the WebRing. In this way pages from all over the world dealing with similar subjects can be linked together. In our case the subject is Atari 8-bit computers, so all pages in this WebRing are about the Atari 8-bit.

The home page of the Atari 8-bit Computer Web Ring is at:

http://www.geocities.com/SiliconValley/Lakes/7953/a8ring.html

and the ring is maintained by Raphael Espino, mailto:rje@co.umist.ac.uk

---

Subject: 7.2) What WWW pages support the 8-bit Atari?

This should be a complete list of WWW pages supporting the 8-bit Atari.

Subject: 8.1) What IRC channels discuss the 8-bit Atari?

==> #atari8 - Just for 8-bit Atari users!

Paul Clark offers this tip:

I think Dalnet carries #atari8, do the following;

telnet://telnet.dal.net

At the login prompt, type;

dalnet

If prompted for a password, just hit enter. You should
be able to navigate to #atari8 from there.......

==> #rgvc - Classic Games and Systems Collectors. "Rec.Games.Video.Classic"

mailto:cmwagner@gate.net (Chad Wagner) writes:

If you have access to a Unix host then you should be able to get to irc by
typing irc at your shell prompt and jumping on an EFnet server
(irc.portal.com, irc.eskimo.com, dewey.cc.utexas.edu) and joining #atari8.

If you are using a host that has a menu system then locate IRC and go there,
and join #atari8 (and hope your on EFnet, :).

If you are using SLIP/PPP then download a client (for Windows users, download
mIRC for Winsock archives, and I would guess that most SLIP/PPP users -- if
they have gotten that far -- are familiar with IRC, :) and select one of
the servers and join #atari8. There is many IRC servers on EFnet, chances
are the one your on is on EFnet.

Subject: 9.1) What's this UUEncoding stuff (.uu, .uue files) all about?

UUEncode/UUdecode is a UNIX utility that will convert a binary file into
100% printable ASCII characters, so that the file may be posted or e-mailed
anywhere a text message can go. The 8-bit Atari is perfectly capable of
UUEncoding/UUdecoding as well. On the archives:

Uudecode 1.2a by John Sangster - very functional.
filenames: Archivers/uudecode.bas, Archivers/uudecode.doc

Yet Another UU-coder by John Dunning - both decoding/encoding.
filename: Archivers/yau.arc

Uudecode.com, Uuencode.com by ??? - "newer, cleaner, easier to use."
filename: Utilities/uue.arc

Dumas UU-coder by John Dunning
filename: Cc65/dumasuu.arc

Subject: 9.2) What is an .arc file?

A file with the extender .arc has been archived in a standard manner that
is common in the MS-DOS world. This is done to make the file shorter,
so it takes up less space on your disk and it takes less time to transfer
between computers. The archives contains several 8-bit Atari archivers
fully compatible with this standard, including:

Super Un-Arc 2.3, Super Arc 2.0 by Bob Puff - highly recommended.
filenames: Archivers/superarc.arc - both Super Un-Arc & Super Arc
Archivers/suprarc2.arc - Super Arc
Archivers/supunarc.com - Super Un-Arc
Archivers/supunarc.uue - Super Un-Arc

Subject: 9.3) What are the .DCM, .ATR, and .XFD file formats?

These are all filename extensions used to name files containing entire 8-bit
Atari floppy disk images.

DCM - Disk Communicator format. Invented by Bob Puff,
mailto:audioguy@cheerful.com for his Disk Communicator 3.2 utility.
Used when working with native Atari hardware.

ATR - Atari disk image format. Invented by Nick Kennedy,
mailto:nkennedy@cswnet.com for his SIO2PC project.
Used when working with non-Atari hardware.

XFD - Xformer disk image format. Invented by Emulators Inc,
mailto:emulators@msn.com for their ST Xformer emulator.
Identical to ATR except without the 16 byte header.
Used when working with non-Atari hardware.

PRO - APE ProSystem format. Invented by Steven Tucker,
mailto:classics@nacs.net for his APE ProSystem device.
Used with APE, the Atari Peripheral Emulator.

Subject: 9.4) What are the .XMO and .BIN file formats?

XMO stands for XMODEM. The idea was that the file was not plain text,
but was a binary file. As a binary file, it had to be downloaded using a
file transfer protocol such as XMODEM. The use of ".xmo" as a filename
extender was popular once, but has been discouraged for years.

BIN - another filename extension sometimes used to designate binary-load
files. Like .xmo, use of .bin is discouraged.

Subject: 9.5) How can I make my commercial boot disk (tape, cart) into a load file or disk image?

Russ Gilbert, mailto:russg@en.com writes:

The disk image part is a matter of taking a copyable boot disk and making an atr, xfd, dcm or other disk image type file out of it, usually for use with an emulator. Before emulators, the Bob Puff .dcm format was used to store/archive/retrieve boot disk images.

Almost all commercial software for the A8 is/was copy protected. For boot disks, this usually involved a large number of special formatting that couldn't be copied using ordinary sector copiers. Usually the boot process involved checking to see if a certain sector error occurred, then proceeding. If the error did not occur, the disk was a copy and would not work.

For carts, usually the method of protection was to write to the cart area of memory and see if the value changed. If the value changed, the cart program was in RAM, not ROM and would fail to operate.

For tapes, again a fair number of schemes were used. Some varied the speed at which the tape loaded. I'm not familiar with tape protection schemes.

With all software media (cart, tape, disk), there may be program encryption, which must be decrypted before the program can run. This to make more difficult disassembly of the program.

There were/are a number of products to defeat copy protection/allow copying of protected software for the A8. The most common way to defeat copy protection was to disassemble the software and revise sections of code so that the copy protection was defeated. A software with defeated copy protection is called a 'cracked' software. The basic procedure is to understand how cart/tape/disk software initializes, loads and runs. Usually make a file out of the software and 'follow the code', starting with loading of the program, to decryption to the actual running of the program. Today, it is unnecessary to copy original commercial A8 software because it has already been defeated and may be found at a few ftp sites. (Note umich archive has no commercial/non-shareware software.)

Besides 'cracking' software, there were/are hardware devices to copy commercial protected software. The Happy 1050 and the Archiver, and probably other modifications to the 810, or 1050 allowed 'bit image' copying and reproduction of the special formatting that copy protected disks had. Using these archiving disk drives, a copy of the original disk,

including all special formatting and the original code is copied, thus making a copy protected copy, not cracked, just like the original.

For carts, copying could involve cracking or again there were/are products to reproduce the cart and simulate a ROM. Or the cart might be copied and burned on the correct type of eprom, to make a plug in cart. 'The Impersonator', the 'Pill' are two cart copy schemes copy the cart to a file, then don't change the code, but use a 'dummy cart' to fool the software into thinking there is a ROM present.

Basic tools for copying, then cracking, carts and disks are a sector editor and disassembler. Carts are usually most easily dumped using a special OS, like Omnimon, to interrupt the cart and dump memory to disk. There are a few pd cart copiers that have the user plug the cart in when the program is running, I don't believe these pd cart copiers are very good or very wise to use.

So, the basic answer to 'how do I make a copy of my copy protected commercial software' is don't bother. Find it on the net.

There is one exception, in that this 'solution' involves a minimum of effort and is relatively safe. I refer to 'Chipmunk' and 'Black Patch' software to make cracked boot disk copy of commercial disks. HOWEVER, even if you use these two commercial archival tools, be sure you write protect your originals, and be careful not to accidentally write to the original disk.

Finally, I'll mention a very modern (I mean 1997) product. The APE Pro system, by Steven Tucker, in the registered version of this shareware allows making disk images called 'Pro' images. APE (Atari Peripheral Emulator) requires a cable, called the SIO2PC cable, that connects the A8 13 pin serial port to a serial port on the IBM PC clone. To make 'Pro' images, a special adapter cable is needed, not just the 'standard' SIO2PC cable. The 'Pro' image can 'capture' the copy protection of an original commercial disk. The 'Pro' image can then be loaded into an A8 using the APE registered version software, thus backing up your original disk software. Note the 'Pro' image will only be of use to person(s) owning registered APE software and 'Pro' adapter cable.

Subject: 9.6) How can I convert my commercial boot tape into a cassette image file?

mailto:ernest@pi.net (Ernest R. Schreurs) writes:

For those of you that like ALL classic Atari software, there is now a way to store all software that has been recorded on cassette tapes on the hard disk of your PC. I have written a program that is similar to the SIO2PC utility written by Nick Kennedy. But this one is intended for use with cassette software. You will need the following items:

Any PC equipped with a sound card and about 50 to 100 Megs of free disk space to work with. The sound card should be able to sample sound at a sample rate of 44.100 Hz mono. The sample must be recorded into a .wav file.
You need the wav2cas program to convert the .wav file to a .cas file. The .cas file is a digital cassette image file that only contains the data that is on the cassette tape. Once you have that, you can throw away the .wav file. The .cas files are typically 16 to 64K, so they are relatively small.

To load cassette files into your Atari (i.e. boot a digital cassette image) you do not need a sound card. You do need a SIO2PC cable or similar device. You also need the cas2sio program.

The wav2cas and cas2sio programs should be available from the archives of Umich by now. They have been put together in one zip file wav2cas.zip, along with the documentation and the 'C' source code.
You can download it through the web interface at the URL
http://www.umich.edu/~archive/atari/8bit/Emulators/Peripherals/wav2cas.zip
Note the capital in Emulators and in Peripherals.
Thanks to William Kendrick for helping me get it uploaded there!
You can also try the gopher stuff:
gopher://gopher.archive.umich.edu:7055/11/atari/8bit/Emulators/Peripherals/

Steven Tucker, the author of APE, has added support for this file format as of version 1.15 of APE. It looks real neat, so try that out too! Thanks to Steven for adding a nice user interface for these cassette images. He did a nice job. I am hoping other using are willing to write some programs to get more enjoyment out of this underrated storage medium.

My stuff is available totally free for personal use, so I hope you enjoy it. Read the docs about the conditions.

Keep those XL's/XE's humming.
If you have any questions feel free to E-mail me: mailto:ernest@pi.net

---

Subject: 11.1) What are the best terminal emulators available?

Here are some of the more popular PD/freeware/shareware terminal programs available.

Ice-T XE v2.72 (128K XL/XE) or Ice-T 800 v1.1 (48K)
shareware by Itay Chamiel, mailto:itayc@hotmail.com
Emulates: VT100
Text: 80 column via a fast-scrolling graphics 8 screen

File Xfer: X/Y/ZMODEM download
Autodial: Yes (2.72) or No (1.1)
Backscroll buffer: Yes--8 screens (2.72) or One screen (1.1)
Capture-to-disk: Yes--up to 16K (2.72) or No (1.1)
Summary: Outstanding flicker-free high-speed VT100 emulation.Recommended!
http://www.sitcom.co.il/users/itayc/

FlickerTerm 80 v.0.51, freeware by LonerSoft (Clay Halliwell)
Emulates: VT100, IBM ANSI
Text: 80 column via a special Graphics 0 screen (no hardware req'd)
File Xfer: None
Autodial: No
Backscroll buffer: No
Capture-to-disk: No
Summary: Fastest and most complete VT100 emulation; readability a minus

BobTerm 1.22, shareware by Bob Puff
(There's also a 1.23 that's specific to PC XFormer)
Emulates: VT52
Text: 40 columns in gr.0; 80 col. w/ XEP80
File Xfer: XMODEM, YMODEM, FMODEM
Autodial: Yes
Backscroll buffer: No
Capture-to-disk: Yes
Summary: Feature-filled; best for BBSing
filename: Telecomm/bterm12.arc

Kermit-65 3.7, PD by John R. Dunning
Emulates: VT100
Text: 40 columns in gr.0; 80 col. in gr.8; 80 col. w/ XEP80 (sort of)
File Xfer: Kermit
Autodial: No
Backscroll buffer: No
Capture-to-disk: No
Summary: Excellent VT100 emulation; rock-solid Kermit Xfers
filenames: Telecomm/k65v37.arc - latest version
Telecomm/k65doc.arc - documentation
Telecomm/k65src.arc - source code

OmniCom by CDY Consulting
Emulates: VT100
Text: 80 columns in gr.8
File Xfer: XMODEM, Kermit
Autodial: No
Backscroll buffer: No
Capture-to-disk: No
Summary: Only option combining VT100, XMODEM, Kermit; buggy at file Xfers
filename: Telecomm/omnicom.arc

VT850 B1, shareware by Curtis Laser
Emulates: VT100/VT102 (plus complete VT220 keymap)
Text: 40 columns in gr.0; 80 col. w/ XEP80

File Xfer: None
Autodial: No
Backscroll buffer: No
Capture-to-disk: Yes
Summary: Only option for VT100 emulation on the XEP80; 1200bps top speed
filename: Telecomm/vt850b1.arc

Subject: 11.2) Can I read/write 8-bit Atari disks on an IBM-PC?

There are several programs that allow an MS-DOS system to work with an
Atari-format diskette. The following require a DOS and disk drive on the
Atari end capable of the SS/DD 180K format:

ATARIO by Dave Brandman w/ Kevin White - Reads SS/DD 180K Atari disks.
filename: Diskutils/atario21.arc

SpartaRead by Oscar Fowler - Reads SS/DD 180K SpartaDOS disks.
filename: Diskutils/sr.arc

UTIL by Charles Marslett - Reads/Writes SS/DD 180K Atari disks. Use MyUTIL!
filename: Diskutils/dskutil.arc
(Older versions are contained in pcxfer.arc, util.arc, and ataridsk.arc)

MyUTIL by Charles Marslett with Mark Vallevand, and
SpartaDOS disk utility by Mark Vallevand
filename: Diskutils/myutil.zip
includes best version of UTIL for read/write of SS/DD 180K Atari disks,
plus Mark's SpartaDOS disk utility v0.1e to access 180K SpartaDOS disks

MyUTIL and the XF551 - tips from mailto:JTKIRK@urp.edu.pe:

]MyUtil works fine with the XF551. The XF551's speed is 300 rpm (sometimes even
]up to 303 rpm). I've got two XF551s and can read/write disks written on a PC
]with MyUtil on both with no problems. MyUtil even can write to a DS/DD disk,
]for a total of 360 K, BUT: the ATARI disks not only have the bits inverted,
]the second side is also read BACKWARDS respect to PC disks. That is, when
]MyUtil on the PC writes to what it thinks is sector 721, it really is writing
]to sector 1440! Worse, if you take an ATARI disk with a file whose sectors
]get past sector 720, MyUtil will attempt to read the sector 2161-n instead of
]'n', and you'll get a 'truncated record' error. The solution is simply to
]rewrite the code to take into account this (if sec>720 then sec=2161-sec).
]Let me know if you modify this. You don't know how frustrating it is to have
]to use only 180 K of a 360 K disk! I'm going to analyze the source code, but
]I don't know if I will be able to modify it properly. If someone does it
]before, please email me and send me an uuencoded copy or tell me where to get
]it.

Here's some advice on using the above utilities from mailto:hans@umd5.umd.edu
(Hans Breitenlohner):

There are two technical obstacles to interchanging disks between
DD Atari drives and PC drives.

1. The Atari drive spins slightly slower (288 rpm instead of 300 rpm).
If you format a disk on the Atari, then write sectors on the PC, it is
possible that the header of the next physical sector will be overwritten,
making that sector unreadable. (The next physical sector is usually
the current logical sector+2). The solution to this is to format all
disks on the PC.
(Aside: Does anybody know how this problem is handled on the
XF551? Is it also slowed down?)
Konrad Kokoszkiewicz, mailto:draco@mi.com.pl answers:
"The XF551 disk drive is not slowed down - these drives are spinning
300 rotations per minute. To prevent troubles with read/write disks
formatted and written on normal Atari drives (288 rot/min), the main
crystal frequency for the floppy disk controller is 8.333 MHz
(not 8 MHz, as in 1050, for example)."

2. If the PC drive is a 1.2M drive there is the additional problem of the
track width. The following is generally true in the PC world:
- disks written on 360k drives can be read on either drive
- blank disk formatted and written on 1.2M drives can be read on
either kind
- disks written on a 360k drive, and overwritten on a 1.2M drive,
can be read reliably only on a 1.2M drive.
- disks previously formatted on a 360k drive, or formatted as 1.2MB,
and then reformatted on a 1.2M drive to 360k, can be read reliably
only on a 1.2M drive.
(all this assumes you are using DD media, not HD).

Solution: Use a 360k drive if you can. If not, format disks on the
Atari for Atari to PC transfers, format truly blank disks on the PC
for PC to Atari transfers.

Jon D. Melbo, mailto:ssilicon@lax.net sums it up this way:
So a basic rule of themb when sharing 360KB floppies among 360KB &
1.2MB drives is: Never do any writes with a 1.2MB drive to a disk that
has been previously written to in a 360KB drive....UNLESS... you only
plan on ever using that disk in the 1.2Mb drive from then on out. Of
course a disk can be reformated in a particular drive any time for use
in that drive. As long as you follow that rule, you can utilize the
backwards compatible 360KB modes that most 1.2MB drives offer.

While the above work with SS/DD 180K Atari-format disks, the following
combination of utilities can be used to work with SS/SD 90K Atari-format
disks, and is currently the best bet for reading SS/ED 128K Atari-format
disks.

AnaDisk 2.07, shareware by Sydex - Reads/Writes "any" 5.25" diskette
filenames: Xf2/anad207.zip, Xf2/anadisk.txt
Apparently 2.07 is buggy.
Anadisk 2.06 is available at: http://ch.twi.tudelft.nl/~sidney/atari/

Deana by Nate Monson - converts AnaDisk dump files from Atari format
filenames: Xf2/deana.com, Xf2/deana.txt

Explanation --> According to mailto:crow@cs.dartmouth.edu (Preston Crow),
"As best as I can figure it out, if your PC drive happens to read
FM disks (I'm not sure what the criteria for that is), then you
can read single density disks on your PC by dumping the contents
to a file with AnaDisk, and then using Deana.com to convert the
dump file into a usable format.
For enhanced density disks, Anadisk generally only reads the first
portion of each sector, but it demonstrates that it is possible for
a PC drive to read enhanced density disks."

Subject: 11.3) Can I read/write MS-DOS disks on an 8-bit Atari?

a) Mule by Rick Cortese - Read/Write 180K MS-DOS disks with an Atari 1050
drive or equivalent. Very limited.
filenames: Diskutils/mule.arc, Diskutils/mule.exe, Diskutils/mule.txt

b) SIO2PC, described elsewhere in this FAQ List (section 11.5), can be
used to read/write to a hard drive connected to an MS-DOS system. This
can also be a very effective file-transfer solution.

c) The XF551 3.5" Upgrades from Computer Software Services (see the
companion vendor/developer list) allow the Atari XF551 disk drive to read
720K 3.5" MS-DOS disks.

d) The Floppy Board, the add-on to the Black-Box from Computer Software
Services (see the companion vendor/developer list), allows both low
density (360K 5.25", 720K 3.5"), and, in the case of the Deluxe
Version, high density (1.2M 5.25", 1.44M 3.5") external MS-DOS-standard
floppy drives to be used on the Atari. A utility is included to
read/write MS-DOS formatted floppies in all supported densities.

Subject: 11.4) How do I transfer files using a null modem cable?

This section by mailto:cb541@cleveland.Freenet.Edu (Russ Gilbert)

Q: How do I connect two cmputers using a null modem cable?

A: You need a term program and RS 232 ports on both
computers. The RS 232 ports need to be connected
together using a 'null modem cable'.

For up to 4800 baud, no flow control lines need be
connected. Just cross the transmit and receive lines
and join the grounds together. Transmit is pin #2,
receive is pin #3 and ground is pin #7 on the 25 pin
port. 25 pin #2 goes to Atari #4 (XMT to RCV), 25 pin
#3 goes to #3 on Atari (RCV to XMT) and #5 of 850 goes
to #7 of 25 pin (GND to GND).

The right hand pin on the 'long' side of a female 'D'
connector is #1. There are 13 holes on this 'long'

side, 12 holes on the 'short' side. The numbers go to the left 1 to 13 then #14 is under #1 and left again so that #25 is under #13.

Most term programs allow a null connection, without a carrier detect. Notably, 'Express 850' does not. I have only used 'Procomm 2.4.3' (the last shareware version of Procomm) on the PC and Bob Term on the Atari, but other term programs may work.

To check your null modem connection, start both PC and Atari term programs, set baud to 2400 or 4800 on both computers. No parity, 8 data bits, 1 stop bit on the PC. Be sure to use the correct COM port on the PC. Go to 'terminal' mode and you should now be able to type on either computer and see it on the other screen. To accomplish a file transfer, use Y-modem probably from Bob Term, rather than X-modem. X-modem will often append bytes to a file transfer, an undesirable event. There is also a very nice Z-modem recieve program for the Atari, called AtarZmodem by Larry Black for the Atari.

A convenient way to make a null modem cable, up to about 30 feet long, is to use two female DB25 connectors (Radio Shack) some three or more conductor cable. Using the two DB25 female connectors allows unplugging your modems and plugging in the null modem cable into the two modem cables. This also avoids the confusion of variations in the computer ports. Most computers connect into the modem end via a standard RS232 DB25 connection. With this both ends 25 pin cable, you would cross pins 2 and 3 and connect the #7s together to make a null modem cable.

The SIO port on the Atari cannot be used directly. An 850, P:R: connection, MIO, Black Box or similar device that provides an RS232 port must be used.

Following are pin assignments for a DB25 pin RS 232 C port.
1. Protective Ground 12. Select Alternate Rate
2. Transmit Data 15. Transmit Clock (sync)
3. Receive Data 17. Receive clock (sync)
4. RTS (Request to Send) 20. Data Terminal Ready
5. CTS (Clear to Send) 22. Ring indicator
6. Data Set Ready 23. Select Alternate Rate
7. Signal Ground 24. Transmit Clock
8. Carrier Detect

For higher speed connections, above 4800 or 9600, you need the flow control lines and Atari term software that has flow control built in. You also need an MIO or Black

Box, which uses the PBI (parallel bus). A high speed cable would need not only XMT, RCV, and GND, but also flow control lines. I suggest a commercial null modem from computer store to ensure correct lines. A null modem is a small adapter with the correct lines already crossed. I don't know how to correctly connect the CTS, RTS, DTR, DSR, CRX lines for a high speed null modem. With a null modem, you just plug it into the 25 pin connectors of the two modem cables you might already have connected to your Atari and PC or Mac. You may need a straight thru 25 pin gender changer also.

Following is in this FAQ elsewhere, but I summarize here: (Figure out or look for pin numbers on the ports.) Note that these are pin assignments, and NOT null modem connections with the XMT, RCV crossed and GND straight thru.

```
Atari 8-bit PC AT 25 PC AT 9 pin
-----------------------------------
1. DTR 20 4*
2. CRX 8 1*
3. XMT 2 3
4. RCV 3 2*
5. GND 7 5
6. DSR 6 6
7. RTS 4 7
8. CTS 5 8
9. No connect? shield RI
22 RI
```

Note: * above indicates the difference between an AT 9 pin and a Atari 8-bit 9 pin cable connector. eg. If you check continuity from pin 3 of 25 pin end and it goes to pin 4 of nine pin end, you have an Atari serial cable. If pin 3 of 25 pin goes to pin 2 of 9 pin end, you have a PC serial cable.
(updated 3/1/99)
(DTE = Data Terminal Equipment ie. your computer.
DCE = Data Communications Equipment ie. your modem.)

Subject: 11.5) What is SIO2PC?

From the SIO2PC home page, written by Nick Kennedy:

SIO2PC is a hardware & software package interfacing the 8-bit Atari to PC compatible computers.

The original idea was to have the PC emulate Atari disk drives so Atari programs could be stored on the PC's hard (or floppy) drives. It turned out to be quite successful. About 95% of my work was in the software, but a hardware

device to convert logic levels was also necessary. This device is now commonly
referred to as an SIO2PC cable.

Features:

Emulates 1 to 4 Atari disk drives

Store your Atari files on PC hard or floppy drives

Boot from the PC, real drive not needed to start-up

No software or drivers required for the Atari;
no conflicts: use your favorite DOS

Twice as fast as an Atari 810 drive and more reliable

Co-exists with real drives in the Atari daisy chain

Compatible down to the hardware level: use sector copiers, etc.

Print-Thru captures Atari print-out and routes to PC's printer

Convert Atari files to PC files and vice versa

1050-2-PC version connects PC directly to Atari disk drive

Nick Kennedy
mailto:nkennedy@cswnet.com
http://www.cswnet.com/~nkennedy/

Another source for building SIO2PC cables is Clarence Dyson's page at
http://www.redshift.com/~cdyson/atari.html

SS/DS SD/ED/DD 38400 burst mode usable only with SpartaDOS X,
SuperDOS 5.1, TurboDOS, DOS XE, and patched SpartaDOS 3.2. XF DS system now
considered "standard".

More data on the XF551 compiled by Marco Antonio Checa Funcke,
mailto:mcheca@li.urp.edu.pe :

Processor: 8040/8050AH at 8.3333MHz (docs say 18.33, but it's a mistake)
Disk controller: WD 1772 02-02 (I opened my drives and looked at the
complete code)
SIO data rate: normal: 19040bps (NTSC)/18866bps (PAL)
high speed: 38908bps(NTSC)/38553bps (PAL)
Rotaton rate: 300RPM
Power source: external power adapter, 9V AC, 31VA, 60Hz (NTSC)/50Hz (PAL)

Operating modes: Single Dual Double Density
Number of sides 1 1 2
Total tracks 40 40 80
Sectors per track 18 26 18
Bytes per sector 128 128 256
Total bytes 92160 133120 368640
Encoding method FM MFM MFM
Transfer rate 125000bps 250000bps 250000bps
Acces time: (maximum)
track to track 40ms 40ms 40ms

motor start 1000ms 1000ms 1000ms

And even more info, from Andreas Magenheimer:
There are two versions - one from Mitsumi and one from another creator .
The mitsumi Xf drive can read and write to a single/dual/double density backside of a 5,25" disk (side b) if it is already formatted. The other drive cannot read nor write nor format the backside because it always looks for the timing hole !! (If you insert a B-side of a disk without a timing hole, it does not stop spinning around...even if this disk is formatted) Therefore the other drive has a flop-mechanism and a sort of automatic-density detection (which is not supported by the OS !!). If you put in a disk, the drive motor starts, trying to read that disk...

For better understanding: a mitsumi drive may need a flop mechanism (so a disk "flops" out, when opening the switch), a density detection (to know the correct density - like a 1050 does !!) and a timing hole redirection (thus not needing a timing hole). The other drive would merely need a timing hole redirection. Both drives then should have a new OS that uses the capabilities to automatically detect the density...

==> CSS XF551
SS/DS SD/ED/DD K-Products US Doubler compatible. Updates drive to work better and faster. Also 3.5" upgrade available

==> Percom RFD4x-Sy
where: x=0 -> a single-sided drive
x=4 -> a double-sided drive
y=1 -> a single-drive unit

SS/DS SD/DD? standard /LEDs and such

==> Rana 1000
SS SD/ED/DD standard /LEDs and such can format disks on a
stand alone basis

==> TOMS 720
double head disk drive, 5.25", with mounted interface Centronics,
chips: CPU 8085, WD2797, PIA 8255 (for handle Centronics), 32 KB ROM, 8 KB RAM
ROM contains: OS of drive, MYDOS 4.50 and some utilities (copy, format, etc.)
ROM is seen by computer as drive D1: (if drive is open), and D3: (when drive
has number D1:) or D4: (when drive has number D2:). It makes possible load DOS
from ROMdisk during booting system.
Formats of disks:
- SS/SD - 40 tracks, 18 sects, 128 bytes = 90 KB
- SS/ED - 40 tracks, 26 sects, 128 bytes = 130 KB
- SS/ED - 40 tracks, 18 sects, 256 bytes = 180 KB
- SS/ID - IBM S-9 - 40 tracks, 9 sects, 512 bytes = 180 KB
- DS/DD - 40 tracks, 18 sects, 256 bytes = 360 KB
- DS/QD - 80 tracks, 18 sects, 256 bytes = 720 KB
- DS/ID - IBM D-9 - 40 tracks, 9 sects, 512 bytes = 360 KB
Transmition modes:
- normal - 19200 bps
- Turbo - 70000 bps
- UltraSpeed - 70000 bps
Also tracks buffering.

==> AS SN-360
double head disk drive, 5.25", CPU 8051, controler WD2797
19200 bps
Available formats:
- SS/SD - (FM) single sided, single density - 90 KB
- SS/ED - (MFM) single sided, enhanced density - 130 KB
- SS/DD - (MFM) single sided, double density - 180 KB
- DS/DD - (MFM) double sided, double density - 360 KB

==> TOMS 710
(The newest polish disk drive and probably the best one)
Similar to TOMS 720, one more format:
- double sided, 80 tracks, IBM (720 KB)
Transmition modes:
- standard 19200 bps
- TOMS Turbo (loaded from ROMdisk if drive is open) - 67000 bps
- UltraSpeed (QMEG-OS, SpartaDOS) - 67000 bps
Also tracks buffering.
ROMdisk contain:
- MYDOS 4.50
- COPY
- INIT
- TURBO - turn on/off TOMS Turbo mode
- BASIC - turn on/off Atari Basic

- AUTORUN.SYS - ramdisk
- README
Also TOMS Navigator instead of DUP.SYS. It is program similar to Norton
Commander on PCs.
IBM-ST copier on additional disk.

==> LDW Super 2000
SS SD/ED/DD 19200 bps or 67000 bps

CPU Z80A, ROM 4 KB, RAM 256 B. Some difficulties with ED

==> LDW CA2002 "California Access"
SS/DS SD/ED/DD 19200 bps, 70000 with SpartaDOS
CPU 8040, ROM 4 KB, RAM 256 B

==> Floppy board various
Any standard very fast parallel
DOS-transparent. Requires Black Box. DS system configurable for
XF Percom or ATR style

==> HDI various
Any standard very fast SIO? European
Sysop Fox-1 writes:
The HDI drive is, like all other I mentioned, connected to the atari 8-bit
SIO-bus. It's a PCB on where you can connect up to 4 PC-mechanics, no matter
it's 360, 720, or 1440Kb, nor 3.5" or 5.25". It's (partial?) developed by
Erhard Puetz (aka Floppy-Doc, aka Sysop Atreju), but is not available anymore
due the lack of the hard-to-get high-speed floppy-controller.

==> SWP ATR-8000
Any standard standard except 1.2 meg and unique DS system
(HD) nice Z80 CP/M system in which CP/M drive acccess is parallel only
thus faster.

==> Atari 1450XLD drives
DS SD/ED DD? standard, requires DOS4. unusual DS system
Only prototypes exist.

==> KARIN MAXI
Double head disk drive 360 KB/5,25" or 720 KB/3,5", controller WD 1772.
Available formats:
= standard SS/SD 90 KB
= standard SS/ED 130 KB
= standard SS/DD 180 KB
= 'cylindric' DS/DD 360 KB (XF551 uncompatible)
= 'cylindric' DS/QD 720 KB (TOMS-compatible; 720 KB drives only)
Any other capabilities depend on a special software.
Transmission mode:
- parallel: real speed 11.25 kilobytes per second with DOS or 22.5 kilo-
bytes per second with special track-copier.

Notes:
Because of the 1772-registers available in 6502 i/o pages ($D100),
the KARIN MAXI drives look full-programmable.
Preferred systems: MYDOS, SDX.

==> XFD-601B
Double head 360 KB/5,25" disk drive. Controller WD 1772, CPU 8051.
Available formats:
- standard SS/SD 90 KB
- standard SS/ED 130 KB
- standard SS/DD 180 KB
- standard DS/DD 360 KB (XF551 compatible)
Transmission modes:
- normal 19200 bps
- Top Drive 1050 70000 bps
What's Top Drive? Konrad M.Kokoszkiewicz, mailto:draco@mi.com.pl writes:
the command is sent as 19200, but all other communication (acknowledge,
data block, completion) is done at 72000 (IIRC).
- Indus GT (synchromesh) 70000 bps (GTSYNC.COM and INDUS.SYS are not necessary;
full-compatible with the SDX)
- UltraSpeed 70000 bps (full-compatible with the older SpartaDOS)
Notes:
Customized sector skew. In fact, the XFD-601B is a original clone of the
XF551.
288 RPM

==> XFD-602B
The two XFD-601B drives in the one unit.

Subject: 12.2) How can I use 3.5" floppy disks with my 8-bit Atari?

to be written. volunteers?

3.5" system Unreleased

Subject: 12.3) What do I need to connect a hard drive to my 8-bit Atari?

original by mailto:Krishna@max.tiac.net (Glenn M. Saunders)

For starters, you'll need to obtain one of the following interfaces:

==> Corvus hard drive (10 megabytes)
Rare.
Fast but still relatively slow I/O, kludge through joystick ports for 800.

==> KPI Hard Disk Drive Interface (formerly Supra)
from K-Products (bobkla19@mail.tcd.net - Bob Klaas)
Some limitations on drive type and size and total number of drives in sys.

==> Multi I/O (MIO) (formerly from ICD)
from Fine Tooned Engineering (FTe) (ftooned@crl.com - Mike Hohman)
256 byter per sector restriction. 256K and 1 meg ramdisk models.
Printer and modem, modem will handle 19.2K bps

==> Black Box
from Computer Software Services (CSS) (mailto:audioguy@cheerful.com - Bob Puff)
Will handle all SCSI drives. Allows 9 drive access for MYDOS. Currently the
only modem interface with CTS/RTS hardware flow control. 19.2K ready.

==> SWP ATR-8000
Rare daughterboard for hard drives.
I/O is probably fairly slow on this baby and there may be DOS restrictions.

==> IDE Hard Drive Interface
from Konrad M. Kokoszkiewicz and Jacek Zuk
(see http://www.orient.uw.edu.pl/~conradus/docs/ide_eng.html)
o Maximum drive capacity: 16777215 physical blocks on each device.
o Maximum number of partitions: 16
o Maximum capacity of a partition: 16777215 logical sectors
o Logical sector length: 256 or 512 bytes
o Average speed (in kilobytes per second, WDC 130AB drive):
- Native mode, sequence of sectors (R): 75
- Emulation mode, sequence of sectors (R): 43
- Emulation mode, back sequence (R): 28
- Emulation mode, random sectors (R): 13
- Emulation mode, same sector (R): 29
- Emulation mode, DOS file (W): 7
- Emulation mode, DOS file (R): 36
o Booting from any partition (on the standard XL OS)
o Write protection capability
o 8 jumpers to set the device number for the operating system
o Sweet 16 compatibility

==> Fine Tooned Engineering Multi I/O II
An IDE interface. Released?

created by Steve Birmanns and Matthias Belitz in Germany
mailto:stefan_birmanns@ac.cybercity.de
mailto:matz@kawo2.rwth-aachen.de
http://www.kawo2.rwth-aachen.de/~matz/atari/
* real device for the parallel-port of the Atari XL-Series
* up to 240 partitions per harddisk supported
* emulates D1: until D9: of disk devices (access to 9 partitions at
one time)
* full bootable from any partition (with standard XL-OS)
* write protectition capability
* supports master/slave configuration

* more than 30 KB/s file access with SPARTA-DOS 3.2 gx (reading)
* more than 10 KB/s file access with SPARTA-DOS 3.2 gx (writing)
* access of ATAPI-CDROM with additional software

Subject: 12.4) What kinds of monitors can I use with my Atari?

In general, you either need a Composite Video monitor, or a standard TV.

Television:
You'll need a video cable (not detachable on the 400/800), and a TV Switch Box. Used with VHF Channel 2 or 3.

Monitor:
The 8-bit Atari produces a color Composite Video signal, plus separate chroma (color) and luminance (brightness) signals which the best composite video monitors can take advantage of. Popular examples of such monitors include the family of monitors produced by Commodore.

Gotcha's:

-the 400 and North American 600XL lack a monitor port entirely. They can only be used with a TV.

-the XE Game System provides an RCA-style jack in place of the Monitor port; so it provides Composite Video but lacks separate chroma\luma signals

-the 600XL, 800XL and 1200XL lack separate chroma signal (can be added via hardware modification)

-the XEP80 Interface Module produces a monochrome Composite Video signal via an RCA-style jack. This higher-resolution signal produces crisp, clear 80 column text on 80-column monochrome composite video monitors.

The pinout of the Monitor port is in the pinout section of this FAQ list. The monitor connector on the back of the Atari can be utilized using a 4-pin DIN to RCA converter. You don't need to build a separate cable.

mailto:buesch@srv.net (Brent Buescher, Jr.) writes:

"The best monitor for an Atari 8 bit that is readily available today would be a television with an S-video input---these tend to be large and high-quality, so the s-video input is the deciding factor there. You'll have to build the cable yourself, and if you have an XL you'll want to do the Super Video upgrade that Ben Poehland published in Atari Classics a few years ago---this puts the chroma signal back on the pin that it should be and cleans up the video signal enormously. It's really more of a fix than an upgrade.

I use a commodore split-video monitor. They work great and are cheap-to-reasonable when you can find them."

mailto:bryede@emi.net (Bryan Edewaard) writes:

"Yes, the best choices are monitors that support "Separated Video" (sometimes called Commodore video on Commodore monitors), or S-Video. These monitors have separate color and luminance video inputs, which give a sharper picture without cross-color artifacts - such as the colored fringes on text when viewed on a TV (although some games use these artifacts to get additional colors). If you have an XL computer, then it needs an upgrade to support these monitors due to the omission of chroma from the monitor port. the 800 and XE computers don't have this problem.

The 2nd best choice is a TV or monitor that has a "Composite Video" (usually called just "Video" or "Aux") input. This is a signal that has the color and luminance information combined into one signal. The picture will be a little less sharp, but still much better than using the "Channel 3" output.

>Where might I find one?

I've seen them a flea markets, garage sales, swap meets, ham fests, and in newsgroups like this one. Plus, many new TV's support S-Video and Composite video inputs.

>What are the advantages of using one of these rather than a TV?

Well, it's all a matter of how many stages the signal must go through.

1. The Atari generates video as a color signal and a brightness (luminance) signal. These are passed to the monitor port as Chroma and Luma signals (XL's have no Chroma output from the factory).

2. The signals are mixed together to make a standard video signal which is also passed to the monitor port as Composite Video.

3. Then the mixed video signal (along with audio) goes through the process of being "modulated" into a TV radio signal (channel 3 or 4). This step involves removing high frequencies from the video (blurring it) and sending it to the TV in a fragile broadcast form that's suseptable to all kinds of interference. Then the TV must (1) extract the video signal from the radio signal, (2) separate the Chroma and Luma components as best it can, then (3) divide the Chroma in R, G, and B. Any of these steps that you can eliminate will help your picture.

>Are there any other composite video monitors that anyone would recommend
>(and where might I find one)?

Maybe the 8-bit FAQ mentions these monitors. The most common one is probably the Commodore 1702 which has a very good picture and is quite reliable.

If you plan to use an XL (which I do), upgrading the video circuitry makes as big a difference as what monitor you choose. Ben Poehland has some excellent articles in Atari Classics magazines for improving the quality of the XL's video, as well as restoring the missing Chroma output."

Lonnie McClure mailto:lmcclure@ibm.net has the last word on Commodore monitors:

Comodore models: 1701, 1702, 1802, CM-141, 1080, 2002, 1902, 1902A*, 1084**, 1084S**.

* The 1902A used a DIN connector for chroma/luma, which makes cabling a bit more of a problem. The composite and audio connectors are standard RCA jacks, however.

** The 1084 and 1084S had more than one version. Some used the a DIN connector for chroma/luma connections, like the 1902A, while some used standard RCA jacks.

The 1902 and 1902A are very different in appearance. The original 1902 shares the same slightly rounded front case design as the 1080 and 2002, while the 1902A is has a rather square case design, and was manufactured by Magnavox (as were some of the 1084 and 1084S versions).

Jerry Jessop, mailto:jjessop1@home.com explains why French Ataris produce fewer colors:

"I will tell you why it only has monochrome out, because it's SECAM and a SECAM GTIA was never produced. The PAL GTIA is used in France and the Lum outputs are run into an onboard encoder to produce a "psudo" color depending on the Luminance output, composite only. This is why a SECAM VCS or 800 has nowhere near the same number of colors (16) availible as a PAL or NTSC unit (256).

The FGTIA was never completed as the market size did not warrant the expense. The largest SECAM market is not France but the Soviet Union (former) and in 80-84 sales of these items there were not possible."

Subject: 13.1) What's the best DOS for the Atari?

This is a matter of opinion, but general consensus is that all 8-bit Atari users should treat themselves to either MYDOS or SpartaDOS to appreciate the power of the system.

Either MYDOS or SpartaDOS will work with almost any disk drive, up to 8 drives or hard disk partitions, and ramdisk.

MYDOS is modelled after Atari DOS 2.0S/2.5, but provides subdirectory and hard-drive support. MYDOS 4.53 is freeware from Wordmark Systems (Charles Marslett and Bob Puff). There are two versions of MYDOS 4.53, one uses 3 digit sector numbers where possible, known as 4.53/3; the other, known as 4.53/4, uses 4 digits minimum. Complete documentation about the disk formats and commands, as well as the source code, is available.

SpartaDOS is a completely different command-line DOS modelled after MS-DOS, though it is perfectly capable of reading all Atari DOS and MYDOS disks. SpartaDOS 3.2g and 3.2gx are disk-based; SpartaDOS X 4.22 is cartridge-based and includes many additional features. SpartaDOS 3.3a and 3.3b were rewritten by Stephen J. Carden for use with BBS Express PRO!. SpartaDOS 3.3c is

produced on a 16K ROM cartridge from Video 61.

It is recommended that all 8-bit Atari users own at least DOS 2.5 for complete compatibility with existing software, and then choose either SpartaDOS or MYDOS as they see fit. DOS 2.5, MYDOS and SpartaDOS are all available on the archives.
filenames: Os/dos25.arc (DOS 2.5)
Fte/fte32g.arc (SpartaDOS 3.2g)
Os/mydos453.dcm (MYDOS - latest version)
Os/mydos45m.arc (MYDOS - latest complete doc's)

Another popular, powerful DOS is BW-DOS, freeware by Jiri Bernasek.
BW-DOS 1.30 and all other versions are available via:
http://atari.boss.com.pl/files

Carolyn Hoglin, mailto:choglin@usa.net adds:
I didn't see TOP-DOS mentioned anywhere. This superior DOS was written by R. K. Bennett of Eclipse Software in Sunnyvale, CA. It was based on Atari DOS, but with many, many more features. It fully supports my double-density, double-sided Astra drives, automatically sensing the proper density and sidedness of both drives 1 and 2. (MYDOS only seemed to do that on drive 1.) Also supported are large ramdisks for Axlon, Mosaic, etc. The latest version was TOP-DOS 1.5+, which came with an excellent manual explaining how to use its powerful capabilities.

Any other versions of DOS all 8-bit Atari users should be aware of??

Subject: 13.2) What hardware has Atari created in the 8-bit computer line?

Computers:
400 Home Computer (1979) 8/16K, membrane keyboard, 400/800 OS
800 Home Computer (1979) 8/16/48K, two cartridge slots, 400/800 OS
1200XL Home Computer (1982) 64K, early XL OS, F1-F4 keys, 4 LEDs
600XL Home Computer (1983) 16K, BASIC, PBI, XL OS
800XL Home Computer (1983) 64K, BASIC, PBI, XL OS
65XE Personal Computer (1985) same as 800XL minus PBI (Europe: includes ECI)
130XE Personal Computer(1985) same as 65XE with 128K plus ECI
800XE Personal Computer(1987?)same as 130XE but 64K. Mostly eastern Europe.
XE Game System (1987) same as 65XE plus Missile Command, detach keybd

XCA12 Program Recorder
CA12 Program Recorder
XC13 Program Recorder -XC12 which was "T2000 ready". Czech/Slovak/Poland
XL12 Program Recorder -XC12 w/slight changed design. Czech/Slovak/Poland
XM301 Modem -300 baud, w/ XE Term software. Permanent SIO cable
XMM801 Printer -80 col. Ribbon: Mannesman/Tally MS80
XDM121 Printer -80 col.letter quality. Ribbon: Silver Reed CF130
XF551 Disk Drive -DS/DD 360K with DOS XE
XEP80 Interface Module -80 col. video display and DB25 parallel port
SX212 Modem -1200 baud, rarely with SX-Express! package.
SIO & DB25 RS232 serial ports.external power supply

For definitive information on unreleased Atari products, see:

Atari Historical Society, http://www.atari-history.com/
(Curt Vendel, mailto:webmaster@atari-history.com)

Atari 8-bit vaporware computers: (note some are more vaporous than others)
800D (Developers Bus System)
1000 Sweet 16 Project, lower end model. Became the 1200XL
1000-X Sweet 16 Project, higher end model. Became the 1200XL
1200 1200XL internally, many slight cosmetic differences
1200XLS 1200XL Show prototype, top-mounted cartridge slot
600 early 600XL, all black case, joyports on the left, missing PBI
800XL brown prototype
800XLF late 800XL with a redesigned motherboard, plus the FREDDY chip
800XLD low-cost 1450XLD, no modem&speech, include disk drive
controller&FREDDY
1250XLD Earlier name for the 1450XLD
1400XL brown prototype
1400XL 800XL plus modem, speech synth.(looks like a 1200XL)
1450XL 1400XL plus room for 2 internal 5.25" drives (controller not included)
1450XLD 1400XL plus 5.25" floppy drive (Epson SD521 360K disk drives)
1600XL Amiga/Amiga-like.Now appears that 1850XLD was the model name for this
1650XLD to use 1450XLD case and 1200XL keyboard

1850XLD "Mickey" Atari clone of the Amiga Lorraine
65XEP 65XE plus 3.5" floppy drive, 5" green monitor
65XEM 65XE plus AMIE/AMY sound chip

Atari 8-bit vaporware peripherals:(note some are more vaporous than others)
815 Dual Disk Drive -2 x SS/DD 180K with DOS 2.0D
816 ????
1053 -looks like a 1050, but supports DS/DD 360K format
1055 -a 1050 (SS/ED) with a 3.5" mechanism
1060 CP/M Add-On Module -"SweetPea" Z-80 CPU, 64K RAM, CP/M 2.2, 80 col display
1090 XL Expansion System-5 PBI slots, CP/M/MS-DOS/Apple II compatible
XM128 -12" green monitor w/ built-in 80-column card
XC1411 -composite 14" color monitor
XF521 -5.25" floppy drive - 1050 compatible, in XE style
XF351 -a 3.5" drive.
XC35 -an XF551 with a 3.5" mechanism
XTM201 -non-impact printer
XTC201 -XE Thermal Color Printer

Subject: 13.3) What are the power-supply requirements for my Atari components?

Thanks to Matthias Belitz, mailto:matz@kawo2.rwth-aachen.de for the European data in this section. I need more international help!

As with the rest of this FAQ list, please let me know if any of this information conflicts with the units you have.

The most important information is the voltage (in volts) required, and whether you need a transformer (AC output) or an adapter (DC output). The power (in watts) and current (in amperes) specifications of the original equipment as presented here should be regarded as minimum values. Higher-than-specified power and current capacities are entirely usable, and often preferable because such supplies run cooler and last longer.

Relevant law of physics:
Power (in watts) = current (in amps) * voltage (in volts)
VA=VoltAmps

N O R T H A M E R I C A: INPUT = 115-120 V AC, 50/60Hz

Subject: 13.5) What BBS software can be used on the Atari?

This section mostly by mailto:winston@merk.com (Winston Smith)
Credit for AMIS to MACE by Steven Sturza, mailto:cordata@ameritech.net

o A.M.I.S. BBS -- The A.C.E. Message Information Service.
The AMIS BBS was written in BASIC by people from the
Michigan Atari Computer Enthusiasts. It included designs for a ring-detector.
You needed a sector editor and had to allocate message space by hand, hex byte
by hex byte.

Steven Sturza adds:
The AMIS BBS was written by people from the Michigan Atari Computer
Enthusiasts.

o FoReM BBS -- Friends of Rickey Moose BBS.
At the time, there were a lot of BBSes around
called things such as "FORUM-80" and "BULLET-80", ergo the name. FoReM BBS
was the first truly RBBS-like BBS for the ATARI 8-bit. It was programmed
in BASIC and was somewhat crashy. I think that this is the
great-grandparent of the FOREM-XE BBSes that survive today.

Matt Singer, mailto:msinger@oe.fau.edu writes:
FoReM BBS derived from an early AMIS. When multiple message areas were
added the name was extended to FoReM 26M. Then, When OSS released BASIC
XL the program was rehacked and called FoReM XL... Bill Dorsey wrote most
of the Assembler routines (where is he now?).

o ABBCS -- The ANTIC Bulletin Board Construction Set.
The user design of the ABBCS was very good. It sported
features such as intra-line editors. Unfortunately, the coding of the
ABBCS was really poor. You could practically blow on your keyboard and
crash this BBS. The BBS would sometimes crash several times a day.

o NITE-LITE BBS -- Paul Swanson's BBS with RAM disk.
Paul Swanson was a programmer from the Boston,
Massachusetts, USA, area. I'm not sure whether his BBS for the
Atari 8-bit has been placed into the public domain or not. This BBS was
the first to support a RAMdisk, which Paul Swanson called a "V:" device
for "virtual disk". This BBS was written in Atari BASIC and required a
joystick hardware "dongle" device. This was notable as being one of the
first Atari 8-BIT BBSes that could actually go for a week without having
to be rebooted. Pointers to the message base were kept in an Atari "very
long string" (for which Atari BASIC is famous). The BBS would only have
problems (for the most part) if this string became corrupted.

o ATKEEP -- An Atari 8-bit version of CITADEL BBS.
I believe that AT-KEEP, like FOREM-XE, requires the use of
the commercial BASIC XE cartridge to run. This BBS program was very
popular around Louisiana, USA, from what I understand.

o Benton's SMART BBS -- BBS written in BASIC by Marco Benton.
This program is written entirely in BASIC. It
expects to be running under a SpartaDOS environment. This was a problem
until very recently, when the disk-based version of SpartaDOS was
re-released as shareware. This BBS program uses a "modem clock string"
rather than an R-Time 8 cartridge in order to retrieve the current time.
It also comes with an Atari BASIC game door called "Sabotage".

o FOREM-XE -- FOREM using BASIC XE.
This version of FOREM BBS requires the commercial BASIC XE
cartridge in order to run. It is in the public domain and can import and
export messages from the Atari PRO! BBS EXPRESS-NET (7-bit text only,
control ATASCII graphics are reserved for message data-structure bytes).
FOREM-XE BBS is still currently in use as we speak, and may be reached via
the PRO! EXPRESS-NET as long as the cross-networking "transnet" is still in
effect.

o The BBS Express -- PRO! BBS demo program.
This is the public domain version of EXPRESS!-BBS,
which is the Keith Ledbetter companion project of the EXPRESS!-TERM
terminal program of days gone by. I am not familiar with this program. I
think that it is written in Action! and only supports XMODEM Checksum
transfers. I have never called or seen this program demonstrated.

o OASIS JUNIOR III -- OASIS BBS demo program.
OASIS JUNIOR III is the --ALL MACHINE LANGUAGE--
demo version of the OASIS BBS program. OASIS is very crash-resistant and
comes with a "dial out" screen so that the Sysop can use the BBS as a
terminal program to call and fetch files without having to bring the BBS
down and reload a terminal program. OASIS supports "Door programs" which
it refers to as "OASIS PAL modules". This OASIS demo module comes with an
excellent message system. The OASIS file system is one of the most
complicated that I have ever seen. It consists of "file libraries" with
suites of "file types". There is quite a bit of overhead involved in
performing a download (which may be a good thing, as it discourages file
hogs). There is a commercial version of OASIS called "OASIS IV" that
performs networking. There was an OASIS network between Boston,
Massachusets, USA and Murfreesboro(SP?), Tennessee, USA. Occasionally word
of the OASIS IV developers reaches the network from New Zealand or Canada.

o Frank Walters BBS -- I know nothing about this BBS except that Frank
Walters wrote it.

o Carina BBS -- a shareware product of Shadow Software.

o BBS Express! Professional -- a product of Video 61, www.atarisales.com

o OASIS IV -- a product of ???

o Forem-XE Pro -- by Len Spencer. http://members.aol.com/lenspencer/

Subject: 13.6) What versions of Atari BASIC or the CTIA/GTIA chip do I have?

Atari BASIC:

At the READY prompt, enter "? PEEK(43234)"

If the result is: You have Revision:
162 A
96 B
234 C

Freddy Offenga, mailto:F.Offenga@student.kun.nl adds:

there's another good answer (IMO):

You can also take a look at the part numbers on the IC's
inside your Atari and compare them with the numbers from
the following table:

```
Part# Version
~~~~~~~~~~~~~~~~~~~~~ ~~~~~~~~
CO12402 + CO14502 A
CO60302A B
CO24947A C
```

CTIA or GTIA installed?

In BASIC, type POKE 623,64 [RETURN] and if the screen blackens, you have the
GTIA chip. If it stays blue, you have the old CTIA chip.

By the way, apparently no CTIA-equipped Ataris were shipped to Europe.

Clay Halliwell, mailto:earl.halliwell@dyess.af.mil provides this tidbit:

A bit of trivia: CTIA 400/800s artifacted in blue/green, GTIA 400/800s
artifacted in green/blue, and all XL/XEs artifact in red/blue.

Subject: 13.7) Which versions of the Operating System (OS) are there?

This section also kept at http://www.student.kun.nl/f.offenga/osroms.txt

Atari 8-bit Operating Systems

(?) This information is missing. If someone can supply this info,
please write me an e-mail.

NOTES:
The 400/800 O.S's consist of three ROMs (two 4kB and one 2kB).
The 1200XL contains two ROMs for the OS (8k each), XL/XE's use a single
16k ROM and the 16k XEGS OS is stored in a 32k ROM (together with 8k
BASIC and 8k for Missile Command).

Origins of ROM information
~~~~~~~~~~~~~~~~~~~~~~~~~~
400/800 rev.A NTSC Could exist, since the PAL version exists and
rev.A is mentioned in the rev.B source code.
400/800 rev.A PAL All info found in two Atari 400's and Atari 800
ROM module CX801.P
400/800 rev.B NTSC Information from a ROM dump and the rev.B source
listing. The part numbers were listed in the
catalog from 'Best Electronics'. According to
'Mapping the Atari' rev.B ROMs have a 'B' at the
end of the part number, therefore I figure these
part numbers are from rev.B.
400/800 rev.B PAL Could exist, since the NTSC version exists and
there's some conditional PAL/NTSC assembly in
the rev.B source code
1200XL rev.10 PAL/NTSC All info found in an Atari 1200XL. The XL/XE
rev.2 source code refers to it as rev.10.
'Best Electronics' calls it rev.A.
1200XL rev.11 PAL/NTSC Refered to rev.11 by the XL/XE source code.
'Best Electronics' calls it rev.B.
XL/XE rev.1 All info found in an Atari 600XL
XL/XE rev.2 All info found in an Atari 800XL
XL/XE rev.3 All info found in an 800XE
XL/XE rev.4 All info found in an Atari XE Game System

O.S. Authors and dates
~~~~~~~~~~~~~~~~~~~~~~
The following info is from the Atari XL/XE rev.2 source code.

Revision A (400/800)
D.Crane / A.Miller / L.Kaplan / R.Whitehead

Revision B (400/800)
Fix several problems.
M.Mahar / R.S.Scheiman

Revision 10 (1200XL)
Support 1200XL, add new features.
H.Stewart / L.Winner / R.S.Scheiman /
Y.M.Chen / M.W.Colburn 10/26/82

Revision 11 (1200XL)
Fix several problems.
R.S.Scheiman 12/23/82

Revision 1 (600XL/800XL)
Support PBI and on-board BASIC.
R.S.Scheiman / R.K.Nordin / Y.M.Chen 03/11/83

Revision 2 (600XL/800XL)
Fix several problems.
R.S.Scheiman 05/10/83
Bring closer to coding standard (object unchanged)
R.K.Nordin 11/01/83

Vapour-ware
~~~~~~~~~~~
The following OS roms originate from rare Atari 8-bit systems.
Since I don't own any of these (unfortunately), I don't have much
information about these roms. Who can help me?

I've got two 16K rom dumps from the 1450XLD. Both ID's are rev.3.
The first dated 3/23/1984 comes from the 'Pooldisk Too' CD-ROM
(filename: 1540os3.v0) and the second dated 6/21/1984 was send to
me by Nir Dary (filename: os1450.128). Main differences between
these two are in the first 3K ($C000 - $CBFF).

The XL/XE OS rev.3B is from an Atari from Arabia. It's probably based
on rev.3. There are changes in the fonts (Arab characters) and several
patches in the code. More info at:
http://www.savetz.com/vintagecomputers/arabic65xe/

Rev. Found in Size CRC-32 Date

Subject: 13.8) What games support 4 simultaneous players on the 400/800?

contributors to this section:
mailto:jlodoen@shell.portal.com (Jeff M Lodoen)
mailto:olavese@online.no (Vidar \"Hawk\" Olavesen)
mailto:pmulvey@erols.com (Pat Mulvey)
mailto:stevenposey@usa.net (Steven E. Posey) (Party Quiz controllers descr)

The following games support 4 player head-to-head play. Remember, only the 400 and 800 computer models sport 4 controller ports.

Asteroids, Basketball, Dandy, M.U.L.E., Maze War, Silicon Warrior, Survivor, Thorn EMI Soccer, Major League Hockey

The following support 8 players on the 400/800 or 4 on the other computer models, using the 2 controllers-per-port CX30 Paddle controllers:

Super Breakout, Worms?

The following supports 4 players on all machines, using special 4-button keypad controllers linked together with RJ-11 jacks (standard phone jacks) to a box with 2 joystick port connectors.

Party Quiz by Suncom

Subject: 13.9) Why should I disconnect the 810/1050 power supply before connecting or disconnecting SIO cables?

Rich Mier writes:

You've been plugging and unplugging the SIO cable with the 1050 power pack plugged in, right? That's a no-no. Most of the time it's Okay, but about 1 in 10, 20 times, it will blow out 'U-1'. It's a CA/LM 3086 I.C. at the right, rear of the main board. A 14 pin DIL chip. Actually it is an array of 5 transistors.

Unplug the power pack from the 1050, then unplug the SIO cable. Power can be ON on the CPU. The problem has to do with the secondary winding of the Power Pack. Remember, the problem only occurs 1 out of 10 - 20 times that you do it, not all the time.

It doesn't really matter if the 1050 Transformer has power on or off, it 'Might' happen if plugged into the 1050. It is really bad on 810's.

One thing, if the system has been turned off for, oh say, 5 - 10 minutes it won't matter. By then all the capacitors should be bled(sc?) to 0 volts.

---

Subject: 13.10) What is Omnimon?

--This section was written by Scott Charles, mailto:scharles@blast.net

Omnimon is a add in board for the Atari 400/800 series of computers and a replacement OS chip for the xl/xe series of computers. The original Omnimon

board fit onto the OS board in the 800 series and had a switch attached to it to disable the board. The 400 series required you to bend the circuit board into a right angle for it to fit inside the 400's case. (It was designed to do this.). The Xl/Xe version replaces the OS Rom chip inside the computer with one that contains the Omnimon code, and a revised OS to make the XL more compatible (no translator disks needed).

Omnimon itself is a machine language monitor residing from $C000-$CFFF, with a few variations. It was designed in 1981 by David C. Young (who also wrote Cartcopy, a copier for the right slot of the 800) of CDY Consulting in Texas. The first software revision of Omnimon had a few basic commands and was only 4K long, only for the 400/800. The second revision required the addition of a bank select switch, and was 8K long. Since it was addressed by the 400/800 as 4K, when you needed to use the code in the other bank, all the text on the screen flips upside down, you flip the switch and hit any key. The Xl and Xe versions of Omnimon do their bank selecting through the normal XL port for this function, so it is seamless.

So what can you use Omnimon for? Its main claim to fame is its ability to interupt any running program by pressing and holding the SELECT-OPTION-RESET keys. Depending on the sequence you press determines what kind of warm boot the Atari does. SELECT+RESET does NO warm boot, preserving the stack and flag values of the 6502. OPTION+RESET allows a warm boot (as if you had just pressed RESET) and interupts the vector at $C (initialation vector).

I think you can see where we are going with this - Omnimon was developed as a machine language developer's tool, much in the same way that the Happy modification was developed for legitimate backups. I.E. far more people use both products for software piracy. If you have an Omnimon! in your machine and you try to boot up an Electronic Arts program, for example, you will get a message that says "REMOVE ROM AT $C000", and the program hangs. (Hence,the need for the disable switch on the 400/800 version. There is no way to disable the xl/xe version, just switch it to an alternative OS.) The 400/800 version, since the disable switch just deselects the mapping of Omnimon to $c000 area, can be switched on and off at will.

I myself did not know what Omnimon was used for until I was using a sector editor on a program called Pharaoh's Pyramid, from Master Control Software. On it is a sector that reads, "REMOVE OMNIMON YOU DIRTY PIRATE". This got me to thinking, what does that mean? After about 5 months of playing around with the Omnimon board, I figured out how to use it to pirate software. In fact, it can be used to make most boot disks into binary files, and remove copy protection from countless more.

At the risk of sounding melodramatic, I can safely say that Omnimon hastened the demise of the Atari 8 bit computer by 2-3 years, because of its power.

---

Subject: 13.11) What is the difference between NTSC and PAL machines?

Software written for NTSC (North America) will always work on PAL machines, but software designed on PAL machines (Europe) won't necessarily work on

NTSC machines.

Wayne Booth, mailto:trek@ihgp15.ih.att.com writes:

The differences with PAL and NTSC have to do with the number of lines displayed on the screen and whether they are using 50 or 60 Hertz.

If I remember correctly, I believe PAL has 625 lines/screen and they refresh the screen 50 times a second doing 1/2 the lines each refresh so they effectively repaint the screen 25 times a second. NTSC is 525 lines/screen with a 60 times a second refresh - again only half the lines each refresh so a 30 times a second frame rate. This would change the amount of time available during vertical sync pulse, and the number of lines that need to be redrawn each time.

Graham Thornton, mailto:nero@chicagonet.net adds:

I use both a real PAL Atari 800 and a PAL-ANTIC 1200XL here in the US.

Replacing the ANTIC chip with a PAL version changes the screen refresh rate to 50Hz which allows most of the PAL-only European software to run. Your system will still report itself as a NTSC machine, unless you change the ROM (see the Nir Dary upgrade), but most software doesn't care.

The one problem you might run into is your monitor. Replacing the ANTIC will mean your North-American Atari is now generating an NTSC signal at 50Hz, instead of the usual 60Hz. Some people will tell you that modern TVs and monitors don't care but that isn't actually true. My brand-new Sony Trinitron 15" colour TV/monitor goes bezerk with the upgraded 1200XL, but my 15-year old 10" Texas Instruments color monitor (designed for the TI-99/4A) is fine.

You can also use real European equipment here in North America, provided that you have a PAL-compatible TV/monitor. The frequency of the power system is irrelevant, as I use my 800 with a 110V/60Hz 1050 power supply.

---

Subject: 13.12) Is the software for the Atari 8-bit computers "TV-standard dependent?"

{some PAL demos flicker, or won't run at all on NTSC machines}

mailto:buesch@srv.net (Brent Buescher, Jr.) writes:

This is because PAL machines have a vertical refresh frequency of 50hz (NTSC use 60hz) which translates into more vertical blanking time for demos and other computation-intensive graphics software. So PAL demos that won't work on NTSC machines are usually returning from a VBI (vertical blanking interrupt) too late. Some also attempt to use more vertical resolution ("longer" display lists) than an NTSC display can handle.

mailto:thor@math.tu-berlin.de (Thomas Richter) adds:

Yes, it is. Mostly because the frequency of the vertical blank interrupt
is different (60Hz for NTSC, 50Hz for PAL). The old OS A was not clever enough
to notice the difference, so all system timings like the keyboard auto-repeat
function depend on the TV system. These parts of the OS have been corrected
with OSB and the XL versions of the OS. However, as most games install a
VBI, their timing does still depend on the frequency -> they will run
slightly slower for PAL versions.

Another point is that the popular pseudo-colors used in the Antic-F
(Graphics 8) mode are not colorful at all when displayed on a PAL TV, because
of differences in the color encoding for the TV. The schematics of
the Xl computers include however a hack how to change the PAL version to
the NTSC version (the PAL versions include two crystals, one with 5/4th of
the frequency of the other. One is used for the system clock, the other for
the color clock), but I never dared to apply it.

---

Subject: 13.13) What programming languages are available for the Atari?

This section also kept at http://www.student.kun.nl/f.offenga/lang13.txt

Revision : 1.3
Date.... : 4/19/1999

==========
!!!! This section is under construction - HELP WANTED !!!!
----------
The goal is to give information about all available languages
for the Atari 8-bit computer. This information will include:
title, last version, author, date and a short description.
It would also be nice to know how to get it and where to get
more information (like reference cards, reviews and such).

Freddy Offenga, mailto: F.Offenga@student.kun.nl
==========

There are quite a lot! To get some structure in this section it's
divided into the following categories;

a) ASSEMBLER
b) BASIC
c) C
d) PASCAL
e) LISP
f) FORTH
g) PILOT
h) LOGO
i) All the rest

The following format is used:

- Language titel (medium)
version, year : version, year
author/company : author/company

available..... : where/how to get it
package....... : programs, documentation
features...... : main features
Description.

The question marks (?) indicate that more information is
required about that topic.

Definitions:
umich University of Michigan Atari archive

Some resources:
- The Multi-lingual Atari, Analog magazine 45, August 1986
- A bunch of manuals
- Some copy-pasted lines from the Atari 8-bit newsgroup

a) ASSEMBLER

- 130XE+ Makro Assembler (disk)
version, year : 2.2, 1992
author/company : Torsten Karwoth
available..... : freeware, ?
package....... : assembler, editor, menu, monitor,
batch enhancement, linker/packer
features...... : macros
Two pass 6502 assembler with integrated menu, editor
and monitor shell. Needs extra RAM banks. Source
format is derived from Atmas Makroassembler.

- A65 (disk)
version, year : ?, 1989
author/company : Charles Marslett, WORDMARK Systems
available..... : freeware, ?
package....... : assembler, manual
features...... : source include
Two pass 6502 assembler. Source format is based on the
Atari Macro Assembler. Assembler source included.

- Alfasm, Turbo-Assembler/16 (disk)
version, year : 1.0, 1990
author/company : Jeff Williams, DataQue Software
available..... : ?
package....... : assembler, docs
features...... : source include
Two pass 6502/65816 assembler.

- Atari Assembler/Editor (cart)
version, year : ?, 1981
author/company : Atari
available..... : ?
package....... : assembler, editor, monitor, manual
features...... : -
Two pass 6502 assembler with integrated editor/monitor

- Atari Macro Assembler (disk)
version, year : 1.0C, 1981
author/company : Atari, APX
available..... : ?
package..... : assembler, editor, debugger, manual
features..... : macros, source include
Two pass 6502 assembler.

- Atmas Makroassembler (disk)
version, year : 2, 1985
author/company : Peter Finzel, Hofacker
available..... : ?
package..... : assembler, editor, monitor, manual
features..... : macros
Two pass 6502 assembler with integrated editor/monitor.

- Bibo Assembler (disk)
version, year : ?, 1986
author/company : Compy-shop
available..... : ?
package..... : assembler, editor, monitor
features..... : source include, data include
Two pass 6502/65c02 assembler with integrated editor/
monitor.

- Datasm/65 assembler (disk)
version, year : 2.0, 1981
author/company : DataSoft Inc.
available..... : ?
package..... : assembler, editor, menu, manual
features..... : -
Two pass 6502 assembler.

- EASMD (disk)
version, year : 1.0, 1981
author/company : OSS
available..... : ?
package..... : assembler, editor, monitor
features..... : ?
Two pass 6502 assembler with integrated editor/monitor.

- Fast Assembler (disk)
version, year : 1.5, 1995
author/company : MMMG Soft
available..... : ?
package..... : assembler, editor, disassembler
features..... : ?

- Kasm65 (disk)
version, year : 2.41, 1994
author/company : Ken Siders
available..... : shareware, umich
package..... : assembler, editor, linker, docs

features..... : macros, relocation, source include,
conditional assembly
Two pass 6502 assembler. Relocatable object files are
compatible with ra65. Source format is derived from
the Atari Macro Assembler.

- MAC/65 Macro Assembler (disk|cart)
version, year : 2.00, 1982
author/company : Stephen D. Lawrow, OSS
available..... : ?
package..... : assembler, editor, monitor, manual
features..... : macros, source include
Two pass 6502 assembler with integrated editor/monitor.
Mac/65 is a direct descendant of the Atari Assembler/
Editor (via EASMD).

- MAE (disk)
version, year : .96, 1996
author/company : John Harris
available..... : umich
package..... : assembler, menu, editor, monitor, docs
features..... : macros, source include, data include,
conditional assembly
Two pass 6502/65816 assembler with integrated editor/
monitor. Extra RAM supported.

- NASM65 (disk)
version, year : ?, 1992
author/company : Nat!
available..... : ?
package..... : assembler, linker, librarian
features..... : macros, relocation, source include
One pass 6502 portable cross assembler (initially for
the ST). Highly compatible with MAC/65.

- PC-65 (disk)
version, year : 1.0 beta, 1996
author/company : Jan Feenstra & Freddy Offenga
available..... : mailto: F.Offenga@student.kun.nl
package..... : assembler
features..... : macros, source include, data include,
boundary directive
Two pass 6502 cross assembler for the PC. The source
format is highly compatible with the ST-65 assembler.

- Quick Assembler (disk)
version, year : 1.0, 1990?
author/company : JBW, Avalon?
available..... : ?
package..... : assembler, editor, menu, debugger
features..... : source include
Two pass 6502 cross assembler with integrated editor.

Very user friendly menu environment.

- Ra65 (disk)
version, year : 1.0, 1989
author/company : John R. Dunning
available..... : public domain, umich
package..... : assembler, linker, librarian
part of cc65 (c-compiler)
features..... : ?

- Synassembler (disk|cart)
version, year : ?, 1982
author/company : Steve Hales, Synapse Soft
available..... : ?
package..... : assembler, editor, monitor, manual
features..... : source include
Two pass 6502 assembler.

- ST-65 (disk)
version, year : ?, 1991
author/company : A. Stauffenberg, F. Offenga
available..... : mailto: F.Offenga@student.kun.nl
package..... : assembler, menu shell, manual
features..... : macros, conditional assembly,
source include, data include,
boundary directive
Two pass 6502/65c02 cross assembler for the Atari ST
written in 68000 assembly. As far as I know this is
the first assembler with the boundary directive.

b) BASIC

- A BASIC Compiler (?)
version, year : 1.03, ?
author/company : Monarch Data Systems
available..... : ?
package..... : BASIC compiler
features..... : ?

- Advan BASIC (disk)
version, year : ?, ?
author/company : Advan Language Designs
available..... : ?
package..... : BASIC compiler
features..... : ?

- Atari 800 Basic (disk)
version, year : 1.0, 1981
author/company : Microsoft
available..... : ?
package..... : ?
features..... : ?

- Atari BASIC (cart)
version, year : Rev.C, 1983
author/company : Atari
available..... : standard ROM in Atari XL/XE
package..... : BASIC interpreter, manual
features..... : pretty plain BASIC implementation

- Atari Microsoft BASIC II (cart)
version, year : ?, 1991
author/company : Atari
available..... : ?
package..... : BASIC interpreter
features..... : ?

- BASIC A+ (disk)
version, year : 3.05, 1981
author/company : OSS
available..... : ?
package..... : BASIC interpreter
features..... : ?

- BASIC XL (cart)
version, year : ?, ?
author/company : OSS
available..... : ?
package..... : BASIC interpreter
features..... : ?

- BASIC XE (cart)
version, year : ?, 1985
author/company : OSS
available..... : ?
package..... : BASIC interpreter
features..... : ?

- Turbo Basic XL (disk)
version, year : 1.5, 1985
author/company : Frank Ostrowski, Happy Computer
available..... : ?
package..... : BASIC interpreter, compiler (V1.1)
features..... : ?
Published in the German magazine "Happy Computer".

c) C

- ACE C (disk)
version, year : ?
author/company : John Palevich & Ralph Walden
available..... : ?
package..... : ?
features..... : ?
This is a newer version of 'Deep Blue C'.

- C/65 (?)
version, year : ?
author/company : OSS
available..... : ?
package....... : ?
features...... : ?
Probably derived from Dr.Dobbs "Small C". Compiles to 6502
code which emulates the 8080 instruction set.

- C65 (?)
version, year : ?
author/company : Keith Ledbetter
available..... : ?
package....... : ?
features...... : good macro assembler
This compiler does not support structs.

- CC65 (disk)
version, year : 1989
author/company : John R. Dunning
available..... : ?
package....... : compiler, linker, assembler, librarian
features...... : ?
Public domain compiler. Also used as cross compiler.
Relocatable object linkage files, and the most thorough
K&R C for the 8-bit. Comes with an relocatable assembler.

- CC8 (disk)
version, year : 2.3
author/company : John Palevich & Steve Kennedy
available..... : ?
package....... : Compiler
features...... : ?
ACE C with more "real" C support (e.g. arrays of pointers
to structs). Requires ACE C runtime libs and linker.

- Deep Blue C (disk)
version, year : 1.2, 1982
author/company : John Palevich, APX
available..... : ?
package....... : Compiler, Linker
features...... : ?
Deep Blue C was originally an independent product, but it
then became available from APX. It converts C to pseudo-
code and then interprets the pseudo code (8080 instruction
set emulation).
Drawn from Ron Cain's public domain C-compiler (Small-C).

- DVC C (disk)
version, year : 1.05, 1985
author/company : Ralph E. Walden
available..... : ?
package....... : Editor, Compiler, Optimizer, Linker

features..... : Quite user friendly program
The compiler generates special object files (.CCC)
which can be optimized and linked. The package uses a
special DOS called DVC DOS which contains runtime stuff.

- LightSpeed C (disk)
version, year : 1.08, 1986
author/company : Clearstar Softechnology
available..... : ?
package..... : Compiler, Optimizer, Linker
features..... : ?
Runs under CLI DOS's and MENU DOS's.

- Tiny-C
version, year : ?
author/company : OSS
available..... : ?
package..... : ?
features..... : ?
First sold C compiler by OSS. This compiler was used to
compile itself! First true language "bootstrap" on any
8-bit machine (it was also available for Apple and CP/M
machines). Derived from Dr.Dobbs "Small C". Compiles to
6502 code which emulates the 8080 instruction set.

d) PASCAL

- Atari Pascal (disk)
version, year : 1.0, 1982
author/company : APX
available..... : APX-20102
package..... : ?
features..... : ?

- Draper Pascal (disk)
version, year : 2.1, 1989
author/company : Norm Draper
available..... : ?
package..... : ?
features..... : ?

- Kyan Pascal (disk)
version, year : 1986
author/company : Kyan Software, APX
available..... : ?
package..... : editor, compiler, linker, macro-assembler
and manual
features..... : ?
Kyan Pascal would run off a single floppy. The Atari (APX)
version needs two drives. A version which runs entirely in
128k should be available too.

e) LISP

- INTER-LISP/65 (disk)
version, year : 2.1, 1981
author/company : Special Software Systems, DataSoft
available..... : ?
package....... : ?
features...... : ?

f) FORTH

- ValForth (?)
version, year : ?
author/company : Valpar International
available..... : ?
package....... : ?
features...... : ?

- Extended fig-Forth (?)
version, year : ?
author/company : APX
available..... : APX-20029
package....... : ?
features...... : ?

- fig-Forth (disk)
version, year : 1.4s
author/company : ?
available..... : ?
package....... : ?
features...... : ?

- fun-Forth (?)
version, year : ?
author/company : APX
available..... : APX-20146
package....... : ?
features...... : ?

- Grafik-FORTH
version, year : ?
author/company : ?
available..... : ?
package....... : ?
features...... : ?

- QS Forth (?)
version, year : ?
author/company : Quality Software
available..... : ?
package....... : ?
features...... : ?

g) PILOT

- Atari PILOT (cart)
version, year : 1980
author/company : Atari
available..... : ?
package....... : ?
features...... : ?

h) LOGO

- Atari LOGO (cart)
version, year : 1983
author/company : LCSI, Atari
available..... : ?
package....... : ?
features...... : ?

i) All the rest

- Action! (cart)
version, year : 1983
author/company : OSS
available..... : ?
package....... : compiler, editor, monitor and library
features...... : fast compiler which generates good code
Needs cartridge for runtime procedures. A PD runtime
library is also available.
All variables are static, so recursive routine calls
are not possible. No floating point type (though a
PD library should make this possible). No arrays of
objects (arrays of POINTERS to objects are possible).

- Quick (disk)
version, year : 2.0, 1990
author/company : Raindorf Soft
available..... : ?
package....... : ?
features...... : ?
This is the "poor man's Action!". Same restrictions as
Action! apply also to Quick. Further restrictions are:
only simple assignment expressions, no records and no
pointers.

- Test Computer Language (disk)
version, year : 2.2, 1985-1990
author/company : D.Firth
available..... : public domain, ?
package....... : compiler and editor
features...... : ?

------------------------------

Subject: 13.14) What is the Atari XEP80 Interface Module?

This section written by: mailto:raukamp@dame.de (Thomas Raukamp)

Since the development of the Atari 8-bit line of computers in 1979, users wanted better text displays than the default 40x24. There has been some attempts to satisfy this need, like the Austin-Franklin board or the Ace 80/80xl cartridge. For more informations about these modifications read The Atari 8-bit Hardware Upgrade FAQ from mailto:david_p@storm.ca (David A. Paterson)

The Atari XEP80 Interface Module is Atari's entry to the 80 column field. It lets a XL, XE, 400 or 800 computer system display a full 80 columns across your monitor screen. The XEP80 provides a 256-character wide by 25-line display window. Up to 80 characters are displayed horizontally at once, and you can scroll horizontally all the way to the 256th character, depending on the application you're running. The XEP80 is connected to your system via a joystick port.

The XEP80 Module interprets commands from the computer for screen display or output to a printer. The module is supplied with an industry-standard 8-bit parallel port so you can connect a parallel printer to your Atari 8-bit (I even use a HP LaserJet IV on my 130XE ;) ).

All programs that use the standard screen call (E:) should be compatible with the XEP80 Module. The software provided by Atari supports a 320x200 graphics mode - this mode only support direct bit images. Note that you can't use all of the standard graphic capabilities of the Atari anymore.

Although Atari recommends a monochrome monitor for usage with the XEP80, it runs fine with any type of composite monitor. The output looks great on my Commodore 1084 for example.

Along with the module comes a software-package containing an AUTORUN.SYS file, which is the XEP80 handler. If you want to use the module with an application that is compatible with the XEP80, which has it's own AUTORUN.SYS file, you can append the application's AUTORUN.SYS on the module's AUTORUN.SYS.

Subject: 13.15) What makes some XL/XE software incompatible with the 400/800?

Konrad M.Kokoszkiewicz, mailto:draco@mi.com.pl writes:

XL/XE software won't work on 800 if:

1) it uses shadow RAM at $C000-$CFFF and $D800-$FFFF
2) it uses RAM expansions at $4000-$7FFF controlled by PORTB $D301
3) it uses specific XL OS functions (like JNEWDEVC)
4) it uses illegal XL OS addresses.
5) it uses European Charset :)

---

Subject: 13.16) What games run only on the 400 and 800 models?

The following are reported as incompatable with models other than the original
Atari 400/800. Most probably do work on XL/XE's if you use a translator to
run the original 400/800 OS on your XL/XE.

Apple Panic Broderbund
Aquatron Sierra On-Line
Atlantis Imagic
Attack at EP-CYG-4 (by Bram) Romox
Bandits
BearJam Chalkboard Inc.
Boulders And Bombs CBS
Chicken Synapse
Disk 50
Dreadnaught Factor, The Activision

Subject: 13.17) What games make use of the Light Gun?

mailto:jmouchmino@aol.com (Bertrand M. (LEXX)) writes:

Bug Hunt, Barnyard Blaster, Crossbow, Crimebuster, Operation Blood, Operation Blood II - Special Forces (not completely sure about that one), Light Gun Blaster (PD), Gangsterville (Italian game written in BASIC), maybe a couple more...

Bertrand M. (LEXX)

James Bradford mentions:
"On the 400, the light gun /pen will only work in joystick port 4." This renders much light gun and light pen software unusable on the 400.

---

Subject: 13.18) How do I type a tilde (common character in Web URL's) on my Atari?

The Shadow, mailto:The_Shadow@spnt.com writes:

The question is: "How do I type the tilde or squigly line which is in most web addresses? I don't have a key for it..."

Answer: The tilde is an inverse backspace on the Atari 8-Bit which can be very hard to type depending on the term program you are using, however you can insert the hex equivalent very easily, which is %7e in place of the tilde and it will work just perfectly. Do not put a space either before or after the %7e.

I (Michael) add:

Some advanced Atari software supports the tilde character natively. E.g., you can type a tilde in Ice-T with the Atari Logo/Inverse Video key.

---

Subject: 13.19) What's the difference between ASCII and ATASCII?

David Moeser -- erasmus att iglou dott com -- produced this nice translation table.

ASCII TRANSLATION TABLE -- IBM & ATARI 8-BIT (ATASCII)
======================================================

SECTION ONE: CONTROL CHARACTERS

Subject: 13.20) What are the PAL, NTSC and SECAM video broadcast standards?

Here are several links on the topic.

http://www.ee.washington.edu/conselec/CE/kuhn/ntsc/95x4.htm

http://www.alkenmrs.com/video/standards.html

http://www.ee.surrey.ac.uk/Contrib/WorldTV/

Subject: 14.1) What vendors, developers, or publishers support the 8-bit Atari?

See the "Atari 8-Bit Computers Vendors and Developers List." Available via:

http://www.faqs.org/faqs/atari-8-bit/vendev/

and Usenet FAQ archives everywhere.

Or you can always ask me for a copy at mailto:mcurrent@carleton.edu

----

Subject: 14.2) Where is my nearest 8-bit Atari BBS?

Trevor Holyoak, mailto:trevor@holyoak.com maintains the "Atari BBS List."

http://www.holyoak.com/atari/

Subject: 14.4) I'm new to the Atari. How do I use this thing?

"The Atari 8-bit New User, Emulator Help FAQ" is maintained by mailto:bill@newbreedsoftware.com (Bill Kendrick). Bill and his FAQ are excellent sources for information on basic usage of the 8-bit Atari, and for information on the 8-bit Atari emulators which run on other computing platforms.

See: http://www.sonic.net/~nbs/new_and_emu.html

If you'd like a text-only copy, simply send e-mail to mailto:bill@newbreedsoftware.com with the subject:

send emulator faq

Subject: 14.5) Can I use an emulator to run my old Atari software on my new computer?

"The Atari 8-bit New User, Emulator Help FAQ" is maintained by mailto:bill@newbreedsoftware.com (Bill Kendrick). Bill and his FAQ are excellent sources for information on basic usage of the 8-bit Atari, and for information on the 8-bit Atari emulators which run on other computing

platforms.

See: http://www.sonic.net/~nbs/new_and_emu.html

If you'd like a text-only copy, simply send e-mail to
mailto:bill@newbreedsoftware.com with the subject:

send emulator faq

Subject: 14.6) What hardware upgrades, modifications and add-ons are available?

The Atari 8-bit Hardware Upgrade, Modification and Add-On FAQ is maintained by
David A. Paterson, mailto:david_p@storm.ca or see:

http://www.geocities.com/SunsetStrip/Alley/1878/hard_faq.htm

Subject: 14.7) What is the HARD-Interlacing-Picture (HIP) format?

HIP is a new method to displaing pictures on small atari...

HIP stands for HARD-Interlacing-Picture and was found by
Members of HARD Software, Hungary in June, July 1996...

It enables to display 160 x 240 Pixels with 30 shades without
nearly all flickering (depends on the source-picture you use)...
HARD stands not for HARD or HEAVY Interlacing, just for the
inventors...

For more information, see the HIP-FAQ, located at:
http://www.uni-karlsruhe.de/~Marek.Tomczyk/Atari8/hipfaq.html

or contact HeAvEn at mailto:k_nadj@s-direktnet.de

Subject: 14.8) How do I access Usenet, FTP, Gopher, and WWW by e-mail?

The Accessing the Internet by E-Mail FAQ is maintained by "Doctor Bob" Rankin,
mailto:BobRankin@MHV.net or see:

http://www.faqs.org/faqs/internet-services/access-via-email/

Can some of you knowledgeable Atarians out there please discuss the pros & cons of the various Atari "8bit" compatible Cassette Players? I know there are *two* different models that were produced as part of the Atari 400/800 line, and then of course there's the Atari 1010 Cassette Player which was part of the "800XL" line. How do these compare to each other? Are there any others I have left out?

There was the 410 for the 400/800, I have 2 types of those, the 1010, and I have seen 2 versions of this as well, but they looked very similar, then an XC11, grey to match the xe range, then the XC12, styled like the xe range. The best, I would say probably a 1010 or xc12, from personal experience, the 410 was not much use. They were all as slow as each other.

Hmmm. I don't agree with your last statement though! I won't use emulators, as I can't get the feel of the real Atari's there. I need to touch the keyboard on the 8-bit. Also, the emulators doesn't run all my demos (come to think of it, none, actually I think).

I know they don't run on NTSC machines though. Maybe someone can tell me how to do it ? My demos are in a ZIPPED .ATR on :
http://home.sol.no/~olavese/atari/a8dl.htm

Anybody want to trade too ? I have some stuff at :
http://home.sol.no/~olavese/trade.htm

Thanks

i just do not understand one thing!

why are you looking for atari?, you are only 12, most pepole who own atari (and still use it) because of sentimental reson!

the 1st atari i got was probabaly when you where born!,

why dont you ask for Pentium 3 500mhz???... unless you are a collector like most of the pepole here, and since you where born into the age of the pentium, the only reson i think you are looking for the old ataru is to sell it!

NIR

What a neat project.. how are the scenes animated on the Atari? Or maybe
are you doing a slideshow? For the sprites, are you blitting things
yourself?

> shots (Like star raiders). The DLI's I use just switch colors or GTIA
> modes. Simple stuff. Maybee a text mode or two. I've got no doubt you

I never had much luck with DLI's- I always wanted to vary the colors of
scanlines as they traversed the screen, but I was unable to get the hang of
it. Have you ever done stuff like that?

<snip zylons>
I recall getting a pirated copy of Star Raiders 2, playing, then deleting
it. I don't remember much of the game though... But boy I remember SR
1.... I bought the cart and had great fun- got kicked out of various home
entertainment stores for playing interminably. A great game, and extremely
innovative for its time. I think a port was made to the 2600 which was
really horrible relative to the 400/800 version...

<for i in 8051 pic pic-nasty lisp bison lex yacc; do snip $i; done>

Regarding vms users, have you ever seen the Unix Haters page? They have
some wonderfully written tirades about various unix misfeatures.. including
a VMS guy who REALLY hates it. A great site, and really funny, though I
don't have the bookmark here...

IE sucks eggs. I have to suffer with it and Outlook at work because of the
godforsaken gateway setup. Blech. I so want to use Netscape and Emacs for
this stuff. They say we're getting DSL soon, hopefully the gateway business
will be rationalized then.

I get lost too- but I prefer it to vi. After all, vi has 2 modes- one where it beeps and one where it doesn't, but it ruins text in both. ;)

> The
> OSI had no screen editor at all. Ctrl-O made an _ underscore and you
> counted the number of underscores for how many characters you wanted to
> delete. Nasty eh ? Well the

Sounds like the line editor in a Sparc system at the University of Maryland nearby. Maybe its poorly configured, but the keymapping/term config is something heinous- no backspace, no line editing, nothing but press enter on the incorrect line (and hope it doesn't wreck things) then retype it (maybe -hopefully- theres a clear line function). Of course, they require students to do many of their programming projects on it, with only a command line debugger available. Absolutely insane- especially considering they multiboot to Linux in all their PC labs....

> I still wonder why Atari didnt crank up
> the speed of SIO for the drives. Isnt that what they do with a warp speed
> mod ?

I think the SIO bus is fixed at 19200 baud, but the standard drives have lots of latency and no caching, readahead or other enhancements. The SIO has a couple io lines they never used- Proceed and Interrupt, both of which could issue an interrupt in the Atari. I think their intent was to support more asynchronous utilization of the SIO bus. I've thought occasionally of trying to make a peer to peer SIO network using it... maybe an Atari cluster- what would you call a mini Beowulf?

Regards,

Gregm

Hi and happy new year everybody

Last year, i visisted a web site with atari commercials

i remember of:
-study.mov
-entertain.mov
-manage.mov
.....

And a link to download QUICKTIME rev 4 to play the video

Does someone have the URL of this site ??

Only trouble with the 1010 was that the play button kept breaking. You used to be able to get a bag of spares from Silica Shop (still got some left I think) - don't know if you can still get them elsewhere?

> The best, I would say probably a 1010 or xc12, from personal experience, the 410 was not much use. They were all as slow as each other.

$.02, last time I gave away an Atari 800 with a broken key or two it cost me
$30 for packaging and shipping.

Locally I could have bought 4-10 Ataris for that much.

Been a long time since I have fooled with SIO2PC cables, but I sold and/or
gave away all my prototypes<except one> and it cost me $2.60 each for
postage and a blister pack to ship them.

You are a bit young to learn economics, but it is actually cheaper to pick
up things locally then it is to have them given to you.

As such, it would have been better to limit the scope of your message a bit
by asking if there are any Atari user groups or Atari users in your area.
Almost all of us have local thrift stores and surplus electronic outfits in
the area where we could point you.

Worst case is you put it back on people i.e. "I will cut your lawn for a
working Atari system" or "I will redo your web pages" or whatever it is you
feel like would be a fair exchange. It doesn't have to be about money, but
should not come across as something for nothing: Work ethic kind of thing.

Well, current status is, I have appended the keypad file to the
autorun.sys (850 handler) and as it happens, the 850 works, and the
keypad works with everything but the terminals programs working with the
850 interface. :)

(sigh!).. back to the drawing board.

My 410 (ca '83) still works fine; some earlier ones generated LOTs of errors.
There was a mod in an early Antic which greatly improved reliability by
replacing some electronics with lower tolerance components.

>600XL and a disk drive (the 1010)

the 1010 was a cassette device

>Is there any software out there that COMES on tape?

MUCH early stuff was available on cassette. Possibly some still around; only commercial title I have on tape is Frogger. We made a bunch of tapes from A.N.A.L.O.G. type-ins.

>can the 600XL support a hard drive?

Simple answer is 'Yes', BUT the File Management System uses about 8K (half of the 16K available) and the DUP menu loads into most of whats left so you are VERY limited in any useful applications unless there has been a RAM upgrade to that 600XL.
-Ron

Well, you will of course need a memory upgrade for your 600XL....but once
you have that, a disk drive will be useful....

It includes an SIO cable, a power supply, of course the 1050 disk drive
itself.....I can make a Dos 2.5 disk for you and even a sparta Dos
disk...stay away from Dos 3.0 as it is incompatible with other Atari
users....they dont use Dos 3.0 (never did actually)....

As far as the 1010 goes,.....did you check the power supply to see if it
is working? I have not seen too many which wont do Anything...

... as in subject. I'm searching for two games with Richard Munns
music: Space Lobsters and Crumble's Crisis. If someone could send
me them in .ATR format....

BTW. Check out the largest Atari Music Archive ASMA

http://mp3.musichall.cz/Unreal/ASMA

Version 1.3 of ASMA contains over 550 tunes from various Atari XL/XE
productions. You can also download from this page SAP player or
Pulse Player, the only Win95/98/NT players that can play .sap files.
Current version of SAP player supports STEREO!!! (two Pokeys
$D200-$D20F and $D210-$D21F). Check "Various\Kwiatek_Grzegorz\Eclipse_Day.sap"
or "Various\Sychowicz_Lukasz\Overmind_1.sap" for example.

I'm sure I speak for many here in csa8 when I tell you that we admire and encourage any genuine enthusiam which you have for "classic" computers. As for MY previous post, you will recall that I did *not* call you any "names". I simply told you that it should be easily within your abilities to earn the small amount of money it would take for "postage" for computer items -- or even to buy whole *computers* (we *are* talking about the cheap-o dinosaur 8bitters, you know! Just a few weeks ago, I bought a fully-working *nice* 800XL at a flea market on a "25 CENT" table, for heavens sake!).
While a love for computers is a great thing, a disdain for "handouts" is also a great thing to build your character as an all-around fine person.
So...congrats on your interest in computers -- but, hey...try and develop that "work ethic" that will do more for you as a person in the long run than a freebie "handout" ever will!

> recall, they always seemed underexploited..
>

I'm not sure where the graphics will fit in compared to other games. It
really burns time working on them and getting them just right. It seems to
take longer and longer to get things accomplished. I'm raytracing the 3d
objects in povray and converting them to GTIA sprites for 3d spaceflight.
The Scenes are raytraced too (in povray). It saves me lots of time, I can
crank out different views by just moving the camera. I was planning on
having it finished by now, and I am looking at another few months still.
The problems I have had with my PC here havent helped. I think the graphics
will fit somewhere between
star-raiders and the koronis rift. I'm using GR.10 for the instrument panel
and MFD's so they have lots of colors. The scenes
are cool. I could gobble up 4 MB easy on those. The current order of
business is some RLE code for decompressing the
GTIA scenes.

I think the demo people do some really fine stuff. They can use the entire
memory of the system, and precompute lots. They also spend more time
working with DLI's and players. I'm working with the bare-metal and not
using tricks. Players in spaceflight are used for targetting, HUD, and
shots (Like star raiders). The DLI's I use just switch colors or GTIA
modes. Simple stuff. Maybee a text mode or two. I've got no doubt you
could do better, the hardware seems capable of amazing things. Gameplay
isnt just graphics , look at Star Raiders 2. It had better graphics than
Star Raiders, but the gameplay sucked IMHO. I think it's because the combat
sucks. You push the stick left and right and it seems to have hardly any
effect on whether the zylons will fly thru your cross hairs. It's so damn
frustrating. Your sitting there thinking 'turn you
hunk of steel'.
< Other opinions welcome >

< re 8051 internal divide by 12 >

Yeah it does something like that, I dont have a databook here or I could
tell you for sure. Whatever it is it's slow.
Kinda the opposite of the PIC if I understand it correctly. Internally the
PIC divides the external clock by four.

<PIC nastiness delected>

Yeah lex and yacc. I tried reading them like you several times. It really
makes you appreciate how smart some people are. Or how stupid I am ;). I
think that the man pages for lex and yacc may be examples of man pages that
vms fans love to point to and say 'you can understand that stuff'. Still
once you learn to work it you could create small miracles.

< App stuff trashed + windows >

I hate windows too, please dont get me started. I gave in a few weeks ago
and downloaded IE for posting messages. I feel bad.

<Atari languages and advantage of instant-on computing snipped>

> I still like the Atari Basic's onscreen editing. Nothing surpasses it

An Emacs fan huh, its to be expected from a Lisp fan. I prefer emacs to VI.
It's a pretty neat editor but it's got so much stuff sometimes I feel lost
like I am programming it. Meta-x Control-Z What the hell was that command.

I think the Atari screen editor was cool. Especially for it's date. The
OSI had no screen editor at all. Ctrl-O made an _ underscore and you
counted the number of underscores for how many characters you wanted to
delete. Nasty eh ? Well the
Atari was only a couple of years later than the OSI's and had full screen
editing, Antic, PM, you name it. The worst thing about the atari was it had
the dog-slow SIO drives. The OSI had parallel access to MPI drives with
extremely fast stepper
motors. You actually had to patch the DOS if you used a non MPI mechanism.
I still wonder why Atari didnt crank up
the speed of SIO for the drives. Isnt that what they do with a warp speed
mod ?

<Rest of nostalgia snipped>

Yeah the OSI's did have good keyboards. I still have an old ICL terminal
keyboard back in NZ. I planned to someday
decode it and use it. It was solid steel and had a zillion extra keys. Man

I miss keyboards like that.

Nope, I've got 16K of memory on it. It's never, ever been upgraded. It started out with my nephew, who gave it to a friend, who gave it to another friend, and now it's mine. I vowed to actually make USE of the darned thing. :-)

Odd, I just inherited a 600XL and a disk drive (the 1010) and was wondering what good it would be. Is there any software out there that COMES on tape? Anyone know of anywhere this might be hiding? I don't have a disk drive yet. Also, can the 600XL support a hard drive? Thanx in advance. I used to own an 800 XL, but it's been waaay over a decade since I've even seen one. Thanx again :)

>There was a mod in an early Antic which greatly improved reliability by
>replacing some electronics with lower tolerance components.

The 410 "Hi-Rel (iability)" mod was my first
venture into my then-new 800 system. I
could not believe how often the 410
crapped out during a load. The mod by
Carl Evans (Tape Topics) really helped a
bunch. Still not as good as the 1010 I picked
up a couple of years later, but a lot better.
Carl had a little controversy with that in that he
talked about purchasing 1% resistors from Radio Shack, but what he later
indicated
was that you take a VOM and check a bunch
of resistors to find those that were very close
to nominal. I was so thrilled to get that 810
drive for $429 from Main Street Computer
somewhere in CA. WOW, the money we spent on those fascinating new toys!

Well, there's the XC-11 and XC-12 for the XE range, but I don't like them.
They are pretty unstable. I prefer the 1010 or my old 410. Most games run
fine on these.

The 5 extra keys are F1, F2, F3, F4, and HELP. They don'd do anything on
the 400 except leave keycodes in PEEK(764).

From: themrfreeze@my-deja.com
Message-ID: <857l27$lq7$1@nnrp1.deja.com>
Source record: 47520

Hi all!

I've been asked to pass along some information by Bob Puff, 8-bit guru and president of Computer Software Services (CSS).

CSS has received enough demand for its Floppy Board product that they've produced a brand new batch of the boards. The Floppy Board, for those who haven't heard of it, is an add-on card for CSS' Black Box product that lets you connect floppy drives of any size, and access them at very high speeds. It also has a number of other features that enhance the Black Box it's attached to.

The production run of new Floppy Boards is pretty small, so there's a pretty limited supply of them. If you're interested in purchasing any, you should give Computer Software Services a call at 716-429-5639 as soon as possible.

For more detailed information on the Floppy Board, you can check out CSS's Web site:

http://www.nleaudio.com/css

Chris

>enable Internet email and ....web access.

Hi. There is no TCP/IP stack (driver) for the Atari 8-bit computers.
As such they cannot directly do internet. They can however do
internet indirectly. Some (very few anymore) ISPs offer what is
called a "shell" account in addition to the full blown TCP/IP via PPP
method. A shell account basically allows a dumb terminal to connect
to the ISP's host machine in a text mode. Characters typed in on the
remote terminal are directed to the host and accepted by the host as
if they were typed in on a keyboard attached to the host machine.
Also, character output on the host machine is directed to the display
of the remote terminal. Essentially then, the terminal then becomes
the keyboard and screen of the host system, but from a remote location
through the use of a modem. The Atari-8 can be made to function as a
terminal through the use of terminal software and a modem.

While connected to the host system running the shell, commands and
programs you type in for execution are actually executed on the host
system. Your Atari merely becomes the eyes and ears of the host. Of
course such host systems are multi user capable and many people can
have a terminal on and in use at once, each going about their business
as if the host were there for just them alone.

Anyway, the bottom line is this: a computer which connects to an ISP
via the full blown TCP/IP method actually becomes a node on the
internet and can execute it's own internet programs. A machine that
connects via a shell account is nothing more than emulating a dumb
terminal connected to the host and is merely a terminal attached to a
machine which is a real node on the internet.

I hope that makes some sense. If your ham buddy can find an ISP that
offers shell accounts, then he can simply run Bobterm (or IceT or
Flickerterm or whatever) and dial in. Once dialed in, it's kind of
like being in Sparta DOS. Actually, it's usually a flavor of UNIX.
You have a some storage space allocated on the Unix system. You can

run TELNET, FTP, MAIL, VI, FINGER, WHOSON, use the LS command etc etc.
In order to transfer files to your Atari, you have to get a modem
protocol type transfer utility and execute that on the Unix machine.
You can get Kermit, Zmodem (usually SZ and RZ for send zmodem and
receive zmodem) , Xmodem & perhaps Ymodem. I suggest Zmodem but I
don't know what terminal software on the Atari-8 supports Zmodem. My
second choice is Ymodem. Ymodem can also do batch transfers.

If your buddy can get setup that way, it would be extremely beneficial
for him to pick up some material on Unix type commands and common
models. Oh yeah, while in a Unix shell, you can often do a 'man'
command. That's short for manual. LS is like the DIR command. If
you type in 'ls -al' you get more details whereas 'ls' by itself is
kinda of like MSDOS's DIR /W command. Try 'man ls' to read the online
help for the ls command.

CSS made the MUX which allowd multiple 8-bits to share SIO
peripherals. I realize that's not multi-processing but it is a crude
form of networking.

223. Re: Donating Computer Stuff for site

Newsgroup: comp.sys.atari.8bit

I have observed the spelling and word usage very closely. I have come
to the conclusion that it is made by someone far more advanced than a
12 year old, but who throws in little mistakes that don't even make
sense for a 12 year old. Also, the mistakes are not consistent. When
people make spelling and grammar mistakes, they most always tend to
make the same mistake over and over.

Furthermore, there is the appeal for all this free stuff for many old
8 bit systems. 12 year olds of today aren't interested in that stuff
in general, and if there would be any interested it would only be
because they already have quite a bit of it and are longing for more
to flesh out certain capabilities that they desire. Also, anyone in
such a position would have been partaking in some of the threads and
participating on a level of interest other than simply posting that
he's 12 years old and wants free shit sent to him.

Sorry, I don't buy it. If that offends anyone then oh well.

See my just previous post for an easier way. If you want to do it by
number though, just choose the 'search' link off the ebay main page.
Scroll down to the search by item nuber box.

Source record: 47537

Notice sometimes he capitalizes his letter I and sometimes not? Also,
'then' is misspelled as 'than' and 'believe' as 'belive'. The 'than'
thing is just plain silly. Most 8 year olds get that one right.
Those that misspell believe usually switch the e and i, or may skip
the i altogether. They might even use a double e. It is a very od
mistake to put in just the i when a long e sound is called for.

Further, he has no trouble with words like 'doubt', 'connection',
'commodore', and the like. Heck, I even misspell Commodore a lot.

I have also noticed him be very exact about the name of this
newsgroup, and being very up on various resources on the internet and
the use of his computer. Yet, seemingly no clue about spell checking.
I know people who are not into computers to put it mildly and know
very little about getting the most out of them. Even they know enough
to use the spell checker.

He also uses words like 'hence' and plays up as a big victim about not
being believed about who he is. That suggests an intellect,
experience base and or perspective that's a bit more sophisticated
than the typical 12 year old. Heck, more than the typical teenager.

It is also extremely uncommon for someone his age to show such an
interest in collecting old 8-bit stuff. Even if such an interest were
present, it then becomes od that the scope of participation in
discussion groups about such equipment is basically limited to
messages begging for handouts, and those messages related to defending
such messages.

It is my belief, that the person responsible for these posts is
actually much older, and probably does / has participated in various
discussions about the platforms that interest him, under a different
identity. Perhaps it is someone hoping to have people send him for
free what he can auction on Ebay for profit. I don't know nor do I
care. I don't buy this story, and even if I did, I don't hand out
stuff for free; especially when the person isn't involved in here in
any other regard.

I don't think it's just that easy. What I was hoping for, is that
the title was also compiled and released on boot disk version.
Sometimes boot disks are hacked up into a single file release so that
would have been cool too. Not a big deal I guess, but it would have
been cool. Thanks for the offer of help.

235. What the heak is your problem?

Did you visit the about me link??
http://members.xoom.com/luecke12/aboutme.html) Ohh yeah that picture is me but you see i'm acuttally 56 but i still look like a 12 year old. Ohh and word usage well thats called doing your english/lit work and accutally studing it! Miss spellings are impossible on my web page because netscape composer checks my spelling for me! By the way nice grammer don't you know the right form of to,too,two to put down? You sound like some 4th grade reject. Duh I didn't study so i flunk. See when i go to school i study so i can get scholarships and other stuff so i can work in the computer field. But you don't know what form form of to,too,two to put down. And you know what you can shuve all that shit up your damn ass and shut the hell up you cheep son of a bitch. I hope your happy because I very seldomly type cuss words on a computer. The problem with you is you got something shuved up your damn ass and don't know what the hell to do about except bitch to everyone else about and make ubseen comments to other people. So I just suggest you shut the hell up. HEY EVERY ONE THIS GUY HASEN'T EVEN MEET ME AND THIINKS I'M OLDER THAN I REALLY AM EVEN WITH A PICTURE OF ME ON MY SITE!!(Well this dude probly thinks I went under millions of dollars in plastic surgery and made me look like i'm 12) So till you accutally meet someone I sugest you shut the hell up and leave best alone!

Well I shouldn't but I forgot that this world is filled with tons of people are mentley screwed up.

Did you visit the about me link?? http://members.xoom.com/luecke12/aboutme.html) What do you think? Ohh yeah that picture is me but you see i'm acuttally 56 but i still look like a 12 year old. Ohh and word usage well thats called doing your english/lit work and accutally studing it! Miss spellings are impossible on my web page because netscape composer checks my spelling for me! By the way nice grammer don't you know the right form of to,too,two to put down? You sound like some 4th grade reject. Duh I didn't study so i flunk. See when i go to school i study so i can get scholarships and other stuff so i can work in the computer field. But you don't know what form form of to,too,two to put down. And you know what you can shuve all that shit up your damn ass and shut the hell up you cheep son of a bitch. I hope your happy because I very seldomly type cuss words on a computer. The problem with you is you got something shuved up your damn ass and don't know what the hell to do about except bitch to everyone else about and make ubseen comments to other people. So I just suggest you shut the hell up. HEY EVERY ONE THIS GUY HASEN'T EVEN MEET ME AND THIINKS I'M OLDER THAN I REALLY AM EVEN WITH A PICTURE OF ME ON MY SITE!!(Well this dude probly thinks I went under millions of dollars in plastic surgery and made me look like i'm 12) So till you accutally meet someone I sugest you shut the hell up and leave best alone!

I'd agree with that - I inherited a 600XL with the 1010 drive, and it's dead; goes ff and rew, but no play/record. I tinkered with it (I'm a PC tech so I gave it a go) and it was a nightmare; I'll just wait for the 1050 disk drive I bought off of eBay. :-)

Have a nice Happy 1050 disk drive with the hardware Happy Controller
installed for sale.

Includes PowerSupply, Original Happy Software and Docs, and a extra
new 1050 drive Mech.

Price $75.00 US Dollars FIRM.

Buyer pays shipping.

If interested contact me at:
phantomm@kih.net

242. Re: About Donating Computer Stuff Part 2

Newsgroup: comp.sys.atari.8bit
Date: 2000-01-09 00:00:00 UTC
From: bowling <mbowlin1@tampabay.rr.com>
Message-ID: <1uSd4.4446$Di.30813@typhoon1.tampabay.rr.com>
Source record: 47601

Well, in any event, no one here is ever "forced" to donate *anything*, so let's simply invite him to share positive and informative posts with the group, instead of "free equipment" requests.
And, just like the rest of us, he can choose to buy equipment from newsgroup sellers' posts if he chooses, or he can ignore them and just benefit from the daily "information exchange" that occurs in our newsgroup.
As for me, I hope that he acquires all the equipment that he wants in a manner which will allow him to feel he "earned" it; and also that he continues his interest in the hobby so that he can contribute meaningfully to the newsgroup.
Welcome, Andy.

From: Aaron Wheeler <aaronat@ihug.co.nz>
Message-ID: <8596cvqa1@news.ihug.co.nz>
Source record: 47604

Hi, I'm on the lookout for the following files in ATR format or
DCM/COM/EXE...

Dark Chambers (got the cart, but want to play on PC)
Airball (same as above)
Desert Falcon (same as above)
River Rescue (same as above)
Crime Buster
Barnyard Blaster (got the cart, want the image)
Crossbow (same as above)
Battlezone
Sky Writer
Alien Garden (got the cart, want the image)
Doc Goodlode's Cavern
Rocket repairman (need a working copy)
Math Encounter (got the cart, need the image)
Powerstar
Astro Droid (need a working copy)
Sammy Lightfoot
Ozzy's Orchard

Any help finding some of these, would be greatly appreciated.
Also any help on how to dump Atari 8bit cartridges would be
great too.

thanks

Aaron

246. Got 1050's?

Ok so its not an Atari 'Got Milk' commercial after all. If
anyone out there has a surplus of 1050's, say 3+ drives and wants
to unload (read: sell) them please e-mail me.

Thanks

Steve

Message-ID: <bP0e4.3111$%O1.49106@sodalite.nbnet.nb.ca>
Source record: 47608

A little while ago I acquired an atari 130xe and a 1050 disk drive. Of course I didn't have any disks to test the drive. The computer works fine though.

I recently acquired an old Cosmi game called Caverns of Khafka but I am not sure how to load it to test my drive. I tried turning the drive on and inserting the disk and then turning the computer on, but that didn't seem to work.

Can anyone give me advice.
Thanks
Davis

LEGAL C`A`B`L`E TV D`E-S`C`R`A`M`B`L`E`R

Want to watch Sporting Events?--Movies?--Pay-Per-View??....FREE!!!!

*This is the Famous R-O Shack TV D-e-s-c-r-a-m-b-l-e-r
You can assemble it from Radio Shack parts for about $12 to $15.

We Send You:
1, E-Z To follow Assembly Instructions.
2. E-Z To read Original Drawings.
3. Total Parts List.

**** PLUS SOMETHING NEW YOU MUST HAVE! ****
Something you can't do without.

THE UP-TO-DATE 6 PAGE REPORT:
USING A D-E-S-C-R-A-M-B-L-E-R LEGALLY

Warning: You should not build a TV D-e-s-c-r-a-m-b-l-e-r
without reading this report first.

You get the complete 6 page report
and instruction package including
the instruction plans, the easy to
follow diagram, and most important
of all the "Using a D`e`s`c`r`a`m`b`l`e`r
LEGALLY Report all for just--$10.00

Fill out form below and send it,
along with your $10.00 payment to:

C.a.b.l.e.t.r.o.n FREE-TV
12187 S. Orange Blossom Trail #116
Orlando Fl 32837

(Cash, Check or Money Order.)
(Florida residents include 7% Florida State Sales Tax)
(All orders outside the U.S.A. add $5.00)

Hi and happy new year everybody

Last year, i visisted a web site with atari commercials

i remember of:
-study.mov
-entertain.mov
-manage.mov
.....

And a link to download QUICKTIME rev 4 to play the video

Does someone have the URL of this site ??

Muller Patrice, french atari collector

Well said, mb!!!
Heck, even the thrift stores have computers for dirt cheap... Just
before Christmas, I got an Apple IIc+, color monitor, external 5 1/4 drive,
and an Imagewriter II color printer...all for $3.96. Excellent condition.
Check out flea markets. Check out thrift stores. Yard sales. Classifieds.
You can find stuff cheap. Good stuff. Heck, when I was your age, I would
trade stuff I didn't use any more for stuff I wanted. Look at Ebay. I am a
chronic ebayer. If you want to buy some stuff when you get some cash, I can
hook you up with some good links.
Welcome to the Realm of Atari, Andy. Good luck in your quest. Just do it
the best way, and that is not always the easiest.

256. Mouse on Atari 8bit?

Newsgroup: comp.sys.atari.8bit
Date: 2000-01-09 00:00:00 UTC
From: X_velcro_X@netunlimited.net
Message-ID: <3878922a.664506@news.netunlimited.net>
Source record: 47615

I would like to use a mouse on the Atari 8bit. I can probably get an Amiga mouse which has a plug like an Atari joystick or paddles. Would it be possible to utilize an Amiga mouse with the paddle commands in Atari BASIC? Mouse left-right = paddle 1, mouse up-down = paddle 2, mouse buttons correspond to paddle buttons?

On that note is anyone familiar with a vendor for Amiga mouses, and did other systems use Amiga-style mouses?

I am really enamored of the BBK Artist paint program which appeared in Analog magazine. I think it is the best paint program for the Atari 8bit. It would be infinitely superior if you could use a mouse with it.

Somewhere in each magazine, usually the contents page, there is usually
a legal paragraph which contains the info you're looking for. You will
find names like Hurst, Ziff-Davis, Gernsbeck, Time-Warner, etc. I
suggest you go to the library and look through a periodical index, or
the actual magazines themselves, if your library has them.

BTW. Creative Computing was known as Elementary Electronics in the
1960-70s. In those days, they covered a lot of basic electronics and
radio/audio material.

: collections....

Yeah, it was on AssKicker, wasn't it? Honestly, while it looked
pretty nice, it was far from Doom.

The framerate was pretty slow (I'd take lower detail for higher
framerate) and the "maze" that the demo walked around in was
very 90-degrees. Also, there were no open spaces.

I suggest looking at Maze of Agdagon. It's multiplayer (networked!)
using GameLink II cables. You can easily build a two-machine cable
with two SIO cables, some paper clips and some electrical tape. ;)

No. Mice aren't analog. They produce a digital "on/off" signal like
a trackball or an Indy 500 Driving controller (which, BTW, _looks_ like
a paddle, but works completely differently and can spin as many times
around as you want it to).

You don't say what if anything did happen, but what you tried was a proper
start.
Have you checked the drive number setting on the back? (#1 is both black &
white switch to the left as you face the switches) Does the disk spin briefly
when you power it on or close the disk latch? Did you press the 'Option' key
while turining on the XE? Did the drive start to boot or respond in any way?
-Ron

That's the name I was thinking of, but when I set out to type it, I
suddenly was no longer certain that was the proper name.

And it was indeed the Active Surplus Annex where I saw the adaptor
for the Commodore 64.

Creative Computing was the creation of David Ahl, in 1974. He had worked
for the Digital Equipment Corporation, and had worked at introducing BASIC
into schools, and had some scheme for a personal mini-computer. I gather
Creative was an extension of that, and so the magazine was around when
small computers hit the scene. As far as I know, it was an independent
magazine, though eventually it was bought up by one of the big magazine
publishers, Ziff-Davis, in the early eighties when there was a computer
magaizine boom, and a lot of independent magazines were being bought up.
I have the tenth anniversary issue, which was a retrospective and still
a nice reference, dated November 1984. If that wasn't the last issue,
it didn't last much longer.

Elementary Electronics was a completely different magazine. I'm not sure
when it started, but I think it morphed from some other magazine, maybe
Radio-TV Electronics, both of which were published by Science & Mechanics
Publishing. It morphed once, or more likely twice, before fading out,
probably about the time Creative Computing died off. Science & Electronics
is one name that comes to mind, though it might be a false remembrance.
And I think it became something with "Computer" in the title. Unlike
Popular Electronics, that changed it's name and tried to become a
computer magazine, and non-technical at that, I don't remember a lot
of change in Elementary Electronics as it changed name, though of
course computers were added, just like every electronic magazine
added computer coverage back then.

I have an extra copy of Track and Field for the 2600 for trade. Its in good shape except a little hole has been punched in the front (you know that little rectangular slot in the middle of the cart) and the track guy on the front has his numbers colored in. (I think it looks better that way, but what do I know....)

Anyway, I'm looking for a Rare boxed 5200 game (send list), or a equally rare 2600 game that's not on my list at:
http://www.msu.edu/user/reicher6/2600.txt

I went to that web site but had a couple of problems...one is that
there's no link to see what computer products they have (under
construction?) - the other problem is that their e-mail link
(info@activesurplus.com) brings up an e-mail window with a completely
different e-mail address, but neither one works...I got e-mail bounces
on both addresses to ask about their computer products.

Is that just me, or have other people had success looking at their
computer stuff on the web?
```

270. Atari 800 in print!

Newsgroup: comp.sys.atari.8bit
Date: 2000-01-10 00:00:00 UTC
From: Will Dwinnell <predictor@compuserve.com>
Message-ID: <387A8095.1BD2573C@compuserve.com>
Source record: 47448
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.programmer

I just wanted to let people know that I was able to sneak in a quick mention of the Atari 800 in my latest article. It is nothing big, but I write for "PC AI" magazine (www.pcai.com/pcai) and my latest article, "Exploring MARS: An Alternative to Neural Networks" appears in the Jan./Feb., 2000 issue. In it, I described MARS, which is a machine learning tool. The bit about the Atari is that I ported a trained model ("memory") from MARS (which runs on Windows) to the Atari. The point I was trying to make is that often, even older (!) hardware can support advanced programming techniques.

Hi all,
I've dug up the old Lucasfilm game, and I was wondering if
it's actually possible to complete it without cheating. I remember
that when I played it on my 130XE I won by cheating (= editing the
module stats - I must still have the info and editor somewhere).
Now I'm running it on the atari800 emulator on linux.

Is there any web page or people willing to exchange info on the game,
such as which modules do what and what strategies are best?

Bye,
Alberto

Very interesting. the screen-shots should be pixel-for-pixel
conversions so the size looks exactly right.

Nice graphical work.

ABBUC is the german user group that is still going strong right?

>
>Recently<in the last year> OSI forced a web site that was distributing
>Ultima IV to take it down. AFAIK, it was because they wanted to use it on a
>cover disk as a freebie and for promotional purposes themselves.

I would bet there was no legal action to "force" the website to take
down the Ultima IV image, if that is what you are saying. I think
TxResumes is correct that the copyright holder must defend the
copyright, in other words Atari 8bit copyright holders can't come back
after <ahem> 20 years of letting those rights gather dust and just
pounce on fans who kept those titles alive on their web-sites. Not
that anyone is doing that.

>You can go to Fry's today and buy a copy of Ultima compilation, 1-8.

I can't. I think we are talking about American copyright law for many
of these 8bit titles.

>For instance, all those "I Love Lucy" reruns you see? story goes something
>like Desi Arnez asked for the tapes of the shows at the time they were being
>made, and was told if he reimbursed the studio for the cost of the tape<they
>were going to record over the previous shows> he could have them.

Did he get them? I recall reading that many early Tonight Show with
Johnny Carson tapes are gone forever because the network taped over
them.

In light of that, the activities of 8bit enthusiasts posting disk
images etc. safeguards the programs against being lost forever. To
prove that I would remind you that Phillip Price who authored
Alternate Reality once posted on this news-group asking someone to
give him a cracked copy of his game.

>This is wrong too, B&C ComputerVisions is still in business. Last time I
>checked they had virtually every game you would want to buy.

No, you are the one who is wrong. B&C do not offer Alternate Reality
or AR the Dungeon. They have a long text of titles but it is unclear
if the titles have the box and docs, or are they just pulling disks
from a stack of old floppies. They appear to be offering second hand
software which would have a whole different set of copyright
implications I should think!

>I have a vested interest in intellectual property. I am currently on just
>over 50 patents and the concept of me losing my rights to the patents
>because I don't stop every idiot that decides to infringe on my inventions
>is preposterous. I may not be able to hunt people down and sue them, but
>that doesn't make it legal! Sheesh!

Yeah, but all you have to do is demonstrate a reasonable effort to
protect your copyrights over time. Then you are covered.

>mouse buttons correspond to paddle buttons?

Without additional software, no. With additional software, yes. I've some
"mouse drivers" which do exactly this for you. There are two possible
solutions, one "without additional hardware" which costs huge amounts of
CPU time to poll the joystick ports (about 50% of the CPU time is lost) or
another with some additional electronics that provides the "counter logic"
for the mice. (Basically, 4 4 bit counters, two shift registers and one
quad EXOR gate in CMOS technology). The last one requires "driver software",
too, but it can be handled more conveniently.

>On that note is anyone familiar with a vendor for Amiga mouses, and
>did other systems use Amiga-style mouses?

I afraid it would be rather hard to get them. Amiga is "more or less" dead.
You might want to try at "www.amiga.de" and check whether they provide mice
as spare parts. Good luck...

>I am really enamored of the BBK Artist paint program which appeared in
>Analog magazine. I think it is the best paint program for the Atari
>8bit. It would be infinitely superior if you could use a mouse with
>it.

Hmm. I've a "moused" version of Atari Artist somewhere for this "hardware
interface" somewhere.

So long,
Thomas

I bought an Atari Portfolio on Ebay, and since have added serial, parallel
and extra storage and memory.

But now that I've done all this, I have no idea what to do with the thing
- considering I already use a Palm V I my PDA.

Anybody out there running automotive maint. software on a Portfolio?
There are several DOS apps that will monitor and measure Dodge, Chev and
Ford auto-computers.. I'm thinking about mounting this Portfolio in my
Dodge Durango or Camaro for just that purpose.

Any suggestions appreciated.

That's because, at the time that EMS was being developed,
the PC's architecture was rather like that of the good old
eight-bit micros. Sadly it's still "like that" under all
the modern glitz ;-)

I'd be tempted to say that the game is absolutely impossible to finish
without cheating.

Actually, even with cheating. I remember editing the game and giving
myself max power module. Even with that, i'd get my ass kicked
eventually.

The size of a 'word' is set by *convention* on any
architecture and/or system; on 6502 based systems it is
usually considered to be a 16-bit quantity. Another example
where the size of a 'word' doesn't follow your argument is
on MC680x0 platforms, where a 'word' is 16-bit despite the
```

fact that the registers and much of the internal hardware
in *all* 68K processors (even 68000) was fully 32-bit.

Why not use something more powerful - e.g. ET4000? I haven't
looked, but I don't suppose it'd be much harder to build
a parallel expansion card for one of the older graphics
accelerators than it would be for the V9990...

That won't stop any Spammers. Spammers want the stuff to be read.
More activity in a group if anything would motivate them to spam more.
Not that they are even paying attention anyway. They probably just
mass dump into many groups and do not track how much other traffic the
group gets. The only real choices are either ignore it or complain to
the spammer's original ISP.

The order of what you did was correct. Try holding down the OPTION key when you turn the computer on. This disables the built in BASIC language, that disturbs most commercial games.

Yeah, their stock is constantly fluctuating. It is the type of place
that you have to visit often to get the really good stuff.

I was there last week and almost picked up an IBM Pentium 75 with
floppy, video, 16 MB RAM, 540 MB hard drive in a case but no keyboard,
monitor, CD-ROM drive or anything else for $100 CDN.

It would have made a nice Linux machine which is something I'm getting
desperate to set up again. :-)

I am looking for an Atari 800 PAL with 220-240 Voltage powersupply.
Atari 800 NTSC is no problem to find but there is no Atari 800 PAL to
be found (yet).
I read in the news groups FAQ that an PAL computer can be used on
"most" NTSC and how to convert them to NTSC. But is there an "easy"
way to convert them from NTSC to PAL?

Source record: 47461

Hello, ive been an atarian for many years, going back into the early 80's (my first computer was an 800xl) but have recently been pulling out the ole atari hardware and playing with it. what I need is help for video cable. I acquired a video minotor (no TV tuner, just a monitor, for such as video camera, and its color) it has a bnc connector for video, I got an adapter, but have a prob: the 800XL's switchbox sends the signal on channel 2 or 3, so the monitor wont pick up the signal, so I was wondering if the video port ON the 800xl will work with this. and if so, what would the pinouts be to work with this standard color video monitor? any help would be appreciated! thanks

Hi

i am currently working on an adaptor that will allow you to connect
a PC ps/2 mice to the atari joystic port.

and the ATARI computer will see the PS/2 mice as it were a joystic, meaning
you will not need a special driver...

more info will be on a web site i am building soon

Denis Leroy <denis_leroy@vt4.net> writes:

> I'd be tempted to say that the game is absolutely impossible to finish
> without cheating.

Ok, I remembered wrong. I was able to win honestly yesterday evening,
by using the "skip a lot" strategy. Basically I started in rift 5,
which has some nice stuff, then skipped to rift 17 (more nice stuff)
and then did rift 19 and 20 without too many problems.

> Actually, even with cheating. I remember editing the game and giving
> myself max power module. Even with that, i'd get my ass kicked
> eventually.

The problem seems to be that every time you kill the saucers, they
return with increased power, so it's fundamental to kill as few as
possible. In my game, when at rift 20, with a 91/90 generator my
shields rarely moved from the max......
The problem of this strategy is that you loot very little, so the game
is not very fun.

Is there a description of all the module types somewhere? There's a
lot I don't remember (or I never found out). The ones I recall are:

- saucer + X ==> freezes saucers in mid-air, too bad they still shoot :(

- crosshairs + |><| ==> auto-targeting? never seems to work

- <---> + \-=-/ ==> improved turn speed for the rover, does it
\-=-/ have any use?

- weight symbol + ? ==> slows you down? no idea

- map symbol + tie fighter ==> activates screen #2 and draws an
overhead map of the rift

- "radio" + (I don't rember) ==> plays music in the rover. Does it do
anything else?

About ECM modules, they don't seem to do anything at all, the saucer
keep arriving very quickly....
Also, is there any module which activates screen #5?

Bye,
Alberto

I am working on a website about alternate computer solutions and I'd like to know what people are using their Atari for? Of course there are the games, but what applications would appeal to a family that doesn't have a lot of money or someone that is interested in getting the most out of their old machines. I'm mainly interested in the 400, 800, 600XL, 800XL, 1200XL, and ST models, but anything would be useful.

Thanks in advance.

I remember an article in a German special edition of "Happy Computer"
magazine, which had an interview with game designer Noah Fahlstein,
who elaborated on the strategies in the game. It also had a few maps
of the terrain and I wrote a TurboBASIC program back then to print
the layout of ALL the maps (they were just 20x20 squares, or so, with
each square just stating if it was a mountain or not). Some of the maps
had fun stuff in them, one has a Copyright (C) and "LFL" below it.

You should check out reboot, a store on queen near Dufferin. They have pentiums (or had) for about $60-$80 and that's with keyboard, cdrom and 15" monitor!

they also have 486-66s, 100s, and even down to sx-25s... starting at about $20.

Dan.

Maybe because the address bus part is 16-bits and a lot of the machine instructions are designed to deal with / interact with 16-bit address parameters. Just a thought.

I had written a similar program to output the maps on the Atari
plotter and I remember weird shapes (rift 7 is a spiral).
The maps also indicated the position of hulks, I think.

BTW what should happen when you've cleared rift 20? I managed to kill
everything, including the "base" (a 2-floor saucer standing on the
ground), but nothing happens and saucers keep attacking me...

Earlier today I went on a searching frenzy and came across several pages on Atari Emulation. My first computer was a Atari 400 with a cassette drive. I soon graduated to a 800 with disk drive and one of the first games I purchased was Alternate Reality the City. I played this game for hours on end. As a matter of fact the morning I was supposed to pick my wife and newborn daughter up from the hospital I was late because I had been up all night playing the City! When Alternate Reality the Dungeon came out I snatched it up fast.

Anyway, I've spent lots of time trying to get one of the many emulators to run the disk images of these two wonderful games with little success. With xFormer 2000 the opening scene and music load ok but nothing else...am I missing something? How do you change disks? I loaded all the disks into separate drives on the program but it doesn't seem to recognize them.

Please help! I'm dying to play these great games again!

> (what language was it in? german? :(( )

Yes, it is German and I don't think it's on the web. I have it right in
front of me now, it's the Game Test Edition #3 from 1987.

> > the layout of ALL the maps (they were just 20x20 squares, or so, with

Oops, they are 64x48 squares.

> I had written a similar program to output the maps on the Atari
> plotter and I remember weird shapes (rift 7 is a spiral).

Yes, exactly!

> The maps also indicated the position of hulks, I think.

Yes. Each Rift (map) has 8 objects.

> BTW what should happen when you've cleared rift 20? I managed to kill
> everything, including the "base" (a 2-floor saucer standing on the
> ground), but nothing happens and saucers keep attacking me...

The article (written by Fahlstein) says that the alien base is not
destroyable by laser.

There's also a table about the "chroma quantisation":

```
Re Or Ye Gr Bl Pu
Re ++ + - - - +
Or + ++ + - - -
Ye - + ++ + - -
Gr - - + ++ + -
Bl - - - + ++ +
Pu + - - - + ++
```

(Red, Orange, Yellow, Green, Blue, Purple)

Shields are vertically, the lasers are horizontally. The table depicts how
good a shield is against a laser. A red shield is good against a red laser,
but a red laser won't do much harm to red saucers. The strength of a laser
is seen by negating the table (+ becomes -). The color brown has a special
meaning...

There is a logical pattern behind which laser is used by the saucers on each Rift. The colors of the saucers also have a pattern to allow the player to select the correct laser early.

The article mentions a special way through the game, which includes only ONE hulk and an "oversight" by the Ancients on Level 20. This allows one to complete the game in 10 minutes (disk version). This trick was supposed to be printed in a later issue, which I don't have.

All of this is much longer, but I don't have time to translate all of it.

Stock 8-bit limited to physical drives numbered one (1) thru four (4) and a RamDisk (usually #8 or 9); add on controllers like MIO or Black Box can go up to 8.

Just to make certain, did you check it with the 600XL? The cassette motor is triggered by a signal from the computer. Poke 54018 (PACTL) with 52 ($34) for ON and 60 ($3C) for OFF.

Whatever you do, do not use DOS 3.0. Atari themselves dumped it after a short while due to software incompatibilities and inefficient use of disk space. The de-facto standard was DOS 2.0. All other public domain and commercial DOS's were upward compatible with DOS 2.0, including Sparta. Atari themselves released DOS 2.5, which is probably the best one as far as both compatibility and 1050 usage are involved.
Other DOSs have advantages for using drives that allow larger disk spaces, including Sparta. The best was SpartaDOS X which was a cartridge based DOS (I still have it).

Yeah but can you load the accumulator (the primary register) with a 16 bit
quantity? Do you have 16 bit index registers ? Can you perform operations
on 16 bit quantities? The answer to all these questions on a 6502 is no.

The "word size" of the 6502 is 8 bits.

Lazy 6502 programmers like to use the term "word" to indicate an unsigned 16
bit quantity (two bytes) ;)

< Original word-size question snipped >

NO! The "word size" of the 6502 is 8 bits. This is correct. However, that
does *NOT* mean that the size of a "word" is 8 bits. Sounds screwy I know.
The reason is that the term "word size" is a piece of hardware terminology,
and refers specifically to the attributes of the hardware. However, "word"
is usually a piece of software terminology - and on 8-bit machines tends
to refer to a 16-bit value. The size of a word is (as I said before)
set by convention.

> lots of your posts and I respect your skill. I wish I had half as

I agree. The size of a "word" is *entirely* subjective; it is simply
a convenient quantity to use to represent numbers with a reasonable
range. This is why it isn't 8 bits on the 6502 - that only has a range
of -128 to +127 or 0 to +255; and a lot of integer quantities lie
outside this range.

> much as you. That being said, I am never the less kind of a precise
> and tech minded person as well, and I find myself often rationalizing

> I think it ought to be isn't necessarily the way it is. Like it or

Yeah. I do this too ;-). I think everyone with enough intelligence
and confidence does at one time or another. It's just a bit gutting
when you argue strongly for how it *should* be, then discover that
it isn't after all ;-) ;-).

> not. As it stands, I personally agree with and understand your idea
> of what criteria defines a word size, but that isn't how it is

It isn't all that clear even if you use such criteria;
for example, do you choose the data paths to the ALU? Or
perhaps the data bus width? Or maybe register width?

> actually defined; even as much as we both want it to or no matter how
> much better sense it makes.
>
> 6502 word size is 16-bits. Like it or not.

6502 word size = 8 bits.

On 6502 platforms, the size of a "word" is 16 bits.

The two aren't the same ;-). The same situation exists on
MC68000, where word size is 32 bits, but size of a "word"
is 16 bits.

>
> Hi James,
>
> > I have always been told that
> > 8 bits is a Byte.
> > 16 bits is a Word.
> > 32 bits is a Long Word.

This is a common myth. Unfortunately, bytes don't all have eight bits
(there were some nine bit machines once that defined bytes with nine bits),
words vary in size from 4 bits upwards, long words don't necessarily
even exist (but if they do, they are usually 32 bits or bigger) and as
for 64 bit things, these could be words, long words, or even quad words.

For most modern machines, a word is their "natural" data size - most
RISC chips adhere strictly to this definition. However, CISC chips and
older MPUs like the 6502 tend to define "word" as 16 bits. There are
a variety of reasons for this - the best being that they had already
named octets (groups of eight bits) "byte", and didn't need another word
to mean the same thing. But also, 16 bits is a convenient size for
general integers (even on 8-bit machines; many integer constants don't
fit in 8 bits) - and convenience was the reason for the "natural" size
definition.

> > I don't know what 64 bits is.

> 8-bit words.

I agree - from a hardware perspective, the 6502's word size is 8 bits.
But from a software point of view, the size of a "word" is 16 bits.
There is a distinction between hardware words and software "words". On
ix86, 16 bits is a "word" despite the fact that the processors are
32-bit, hence their hardware word size is 32 bits.

> Even your statement of 8 bits to the byte is perhaps overly optimistic.
> In high-quality specs, 8 bit quantities are called "octets" (for
> example, internet RFC's). A byte is more like the smallest amount of
> data the processor can fetch from/store in memory, which just happens to
> be 8 bits on most machines. There used to be exceptions though. For

There's still argument about this. The UNIX fraternity tends
to insist on the use of octet as opposed to byte - but that's
mainly because they are the only group that has had to use machines
with 4 or 9 bit bytes. There are RISC chips (e.g. early ARM processors)
on which it is impossible to access anything other than 32-bit words;
but they don't call 32 bits a byte ;-). I tend to think the "octet"
purists are being a little silly these days; after all, everything
works in terms of bytes - just imagine trying to read a text file from
a PC into a machine with 9 bits in each byte. Or even trying to load
an image file.

> precisely this reason, the C header file "limits.h" defines a macro
> CHAR_BIT, that holds the number of bits to the byte.
>
> All in all, what's in a word?

> Regards, Sidney
>
> PS. we could of course agree to disagree, but you 16-bit people should
> really go to comp.sys.atari.16bit then ;-)

I think the 16-bitters are talking at cross purposes with
the 8-bitters. 16-bits -> size of "word". 8-bits -> hardware
word size. The two aren't the same, so there's no
disagreement.

Regards,

Alastair.

>
> NOT TRUE

Quite right. The software would only enter the Public Domain
if the author/copyright owner put it there, or the copyright
expires for some reason. HOWEVER, it doesn't pay to be silly
about this. The people owning copyrights on 8-bit software
and hardware in the vast majority of cases have already
written it off as obsolete, and therefore don't really care
one way or another.

That's not to say they don't want to keep the copyright
control; as was said, Hasbro have retained the copyrights
(as well, I suspect as some of Atari's large patent
library). But they almost certainly (I haven't asked them,
but I'd be surprised if they disagree with what I'm about
to say) don't care about the *original* software on the
*original* 8-bits. There is a minute chance that they care
about the original software under emulation on the PC - but
I doubt it; the entire point as far as they are concerned
is that they can release better versions of the original
games as well as conversions of the original original.

The free availability of many old software titles on the
Internet is very useful for many reasons - for example,
I only had a 1010 tape deck (no disk drive), so most of
my software is on tape. Now I've written a program to
transfer the data across, but in order to actually get
something working you need a good working knowledge of
the micro's architecture and especially 6502 assembler.
I have done this for some of my software, but it's quite
hard work (I have to do my own loaders for the tapes).
Some people don't have the necessary skills, despite
having the original software on tape. Arguably even this
```

is a copyright infringement ("reproduction"), but again I think it would be foolish to suggest that the copyright holders actually mind.

Indeed, some people have been very pleasantly surprised by some publishers' ideas about their intellectual property - for example, there have been cases of publishers providing a copy of their own software for a newer platform after an existing owner moved platforms (most commonly from Amiga to PC or Atari ST to PC) for little more than the cost of the media and postage (or even digitally over the Internet for free!).

Copyright owners aren't money grabbing monsters, but they do feel wronged by the prolific software piracy that seems to be a feature of modern society (in a recent article in the Times newspaper, an estimate was made that approximately one third of all software in the UK is illegal). In what other trade are people willing to steal the fruits of many man-years of people's hard work? The only other industry with such a huge piracy problem is the music business - and it doesn't take nearly as long to record an entire CD as it does to write a modern commercial computer program (even several years ago this was the case).

But the fact is that a lot of the software you people are arguing about is very old - even the copyright owners often don't have copies of it, and they certainly don't anticipate any further profits from it.

If you really want to be white as white, then go ahead and contact the publishers/copyright owners (if you can find them). It's very unlikely that they'll object to you copying their software. Maybe they'll even give you the source code (if they've got it) if you ask nicely ;-).

Regards,

Alastair Houghton.

You could always write an x86 emulator in 6502 assembler ;-)
;-) ;-)!

(and besides, you can get RAM upgrades up to about 1MB)

That's absolutely false. You may want to read up on copyright law.

> Add to this the fact that nobody owning those copyrights has made any
> money for many years on their software sales and you have another
> reason why they would not bother to legally defend the copyrights
> either.

Many classic gaming titles have been re-released in recent years. In
every case, whoever currently owns the rights has received royalties as
a result. When Atari was still an independent corp., they were making
more money from royalties on old stuff than they were on their current
products, as I recall.

Some people also feel its important to support those commercial vendors
still selling new-in-the-box software for the 8-bit Atari.

-Michael

I went to Furman Univ. in 1974 and played the HP Star Trek. When the TRS-80 LEVEL II came out I went back to Furman to take notes in preparation to write a TRS-80 version.

My version has all the features of the HP version plus a few new features and bug fixes (even planets that I never created a use for). Its formatted for the TRS-80 and even has some corrections to the targeting and navigation formulas.

As for the book, I would be happy to scan it and add it to the collection of TRS-80 manuals and books on my web site so every TRS-80 fan who wants one can have their own copy.

I don't know if the site that I am about to mention has those
commercials that you are mentioning but this site does have Atari
commercials of different types: The URL is:

http://www.papabyrd.com/atari/

The other site that I am aware of is:

http://aegis.mcs.kent.edu/~clisowsk/8bit/movies.html

I hope that helps.

>
>
>

Only two emulators in existence that I know of will play both AR games
(City and Dungeon) almost flawlessly: Atari800 (both DOS and Win
versions), and XL-It! (DOS). Both AR games were my all-time
favourites (even to this day -- it took the PC 5 more years before it
discovered texture mapping), so I made a special point of making sure
I kept up to date on these two emus. Everything from the title right
through work unbelievably well. Both emus support multiple drives,
too; The City will recognise two drives, and The Dungeon will do four,
so you can just plunk the disk images in and forget about swapping in
the Dungeon, and have minimal swapping in The City.

Both emulators are available at
www.vintagegaming.com/emulators/atari8emu.html (the quasi-resurrection
of Dave's Video Game Classics)

How about a Pentium 75, 32MB RAM, 1.2GB HDD, 4x CDROM, 14" SVGA
Monitor, Keyboard, Mouse for $199.00 U.S.?

Try www.maventech.com

I set these up for people on a super tight budget that want to
basically do internet and Office.

>Yeah but can you load the accumulator (the primary register) with a 16 bit
>quantity? Do you have 16 bit index registers ? Can you perform operations
>on 16 bit quantities? The answer to all these questions on a 6502 is no.

But that/those wasn't/weren't the question. The question is what is
the word size of the 6502. Answer: 16 bits.

>The "word size" of the 6502 is 8 bits.

No offense, but if Bill Wilkinson says the word size is 16 bits then I
tend to believe it.

>Lazy 6502 programmers like to use the term "word" to indicate an unsigned 16
>bit quantity (two bytes) ;)

I doubt it has anything to do with being lazy. What I think it has
everything to do with, is you being a very precise & technically
minded person, find yourself defining the criteria for word size
according to your standards and what makes sense to you. In other
words, the standard that you think "ought to be." Peter, I have read
lots of your posts and I respect your skill. I wish I had half as
much as you. That being said, I am never the less kind of a precise
and tech minded person as well, and I find myself often rationalizing
things the way _I_ think they should be. I'll often be almost done
convincing myself that what I feel the definition for something should
be actually _is_. Then I'll snap out of it and remember that the way
I think it ought to be isn't necessarily the way it is. Like it or
not. As it stands, I personally agree with and understand your idea
of what criteria defines a word size, but that isn't how it is
actually defined; even as much as we both want it to or no matter how
much better sense it makes.

6502 word size is 16-bits. Like it or not.

353. Preliminary version of Atari ROM source listing available.

Newsgroup: comp.sys.atari.8bit
Date: 2000-01-12 00:00:00 UTC
From: Sidney Cadot <sidney@ch.twi.tudelft.nl>
Message-ID: <387C037F.E3AC5A2C@ch.twi.tudelft.nl>
Source record: 47406

Hi everybody,

As of now, a preliminary version of the Atari XL/XE ROM sources I made
(BASIC, Self-Test ROM and OS) is available.

You can get them them from my Atari page at
http://ch.twi.tudelft.nl/~sidney/atari. The sources can be assembled
(using TASM 3.1 from http://www.halcyon.com/squakvly/ for now) back into
the XL/XE ROM files, as required by
emulators such as Atari800.

This is very much a work-in-progress, although progress has been slowed
down to a crawl due to the fact that I am
very busy. I don't know if I'll ever finish it. I secretly hope some
dedicated Atarian will take over...

To forestall an argument: me publishing the ROM sources may not be 100%
legal (I honestly don't know). However, legal
issues aside, and without wanting to start a flame war, I think it is
morally acceptable, since

(a) nobody can seriously claim to have a commercial interest in these
ROM sources;
(b) the binary versions are available in the XFormer 3.8 package, that
can be downloaded for free from
www.emulators.com;
(c) the only purpose for an electronic ROM source listing is education
and preservation.

Notwithstanding that, if you are the holder of the copyright to the
source (if it is still in place - I don't know)
and object to these sources being electronically available, I will
remove them forthwith. I would have contacted
you if I knew who you were. A note saying it's ok would be very much
appreciated. Please consider it a favour to a bunch of people with an
admittedly strange, but otherwise innocent hobby :-)

I would make the source public domain if it was up to me. As far as I
have a say in this, you're free to do whatever
you see fit with the sources I made. Then again, this may not be up to
me.

Have fun, all!

Sidney Cadot

354. Re: technical information request (6502 word size, to be a bit more precise)

Newsgroup: comp.sys.atari.8bit

Source record: 47407

Hi,

> 6502 word size is 16-bits. Like it or not.

Just jumping in half-way, sorry about that, but this statement _does_
draw my attention.

As far as I can see the only thing that's 16 bits about the 6502 is the
address bus and
therefore addresses themselves. Just about everything else is 8 bits. We
surely agree on that.

I am very curious about your definition of word size (may have missed
it). At least 4
possibilities spring to mind:

* register width (8)
* data-bus width (8)
* address-bus width (16)
* ALU width (8)

I'd say the address-bus width is a rather peculiar pick. Intuitively I'd
say the register width or ALU width
are most important. Somehow a "word" sounds to me like the amount of
bits the processor is most efficient at
handling. But I don't have a textbook at hand stating a definition;
besides that, yours, Bill Wilkinson's,
or anybody else's definition is as good as mine I suppose.

We could just settle on calling the 6502 an 8/8/16/8-bit processor. Or,
being politically correct and taking
averages, a 10.000 bits processor :-)

- Sidney

PS: pop quiz: what microcomputer featured a 19.000-bit processor?

>Bottom line, is if you want one of these rare items, you better get one before they are gone....>

Ok, I ordered one yesterday. And am considering making it two. FWIW, the Black Box/Floppy Board is one of the very best things that one can get for the A8. I tried to buy another FB a couple of years ago as a "spare", but of course, CSS has been out of stock until now.
You can use readily available, modern 3-1/2" SCSI hard drives, SCSI ZIP drives, and the FB gives you parallel speed for up to 4 drives, including High Density. A 1.44 HD floppy gives 5760 DD sectors (less directory/ VTOC). And if you think that Ultra Speed is fast, you ought to hear parallel speed from a FB. Screen Dumps from the BB. Read and Write PC disks...
It's quite a pair of devices, and CSS has not raised the price on this run of FB!

So what is the BEST emulator for the 8 bit. I've been playing with XFormer 2000 and the big problem I have with it is that I can only find SpartaDOS 3.3 16 meg partitions which can run with it and they dont seem to like the SpartaDs 3.2D MENU.COM which I am most familiar with and dont like typing DOS commands that much to DO stuff

(I'm apparently Windows 95 Spoiled by now)

Any ideas anyone? I just need a working SpartaDos X32D 16 meg bootable partition which can work with the MENU.COM to be happy with the darn emulators but none seem to like this DOS.

The other thing I wanted was a version of TurboBasic for SpartaDos which would work but so far all I have found is FrostBasic which does not seem to work either but it looks like it has its own Dos with it. Any interest in Frost Basic anyone I can post it if so.. Suposedly a custom version of TurboBasic by Frank Ostrowski which worked on the old 800/400 machines where TurboBasic only works on XL/XE machines.

Actually I have been using ATARIDSK.EXE on the PC with an old 1.2 meg 5.25 inch floppy to read most of my 8 bit software. If will read single or double density and can even write XL disks too.

The reliability is mediocre and not all disks can be read. The IBM floppy does not read disks which were written to the flip back side because it needs the little round timing hole which Atari drives apparently did not use! I wind up using the old 1050's to burn fresher copies to the fronts of the disks so the IBM can read them.

Stuff written on the 1.2 meg floppy has a very narrow track and so fresh disks or bulk erased disks work better and I usually have to copy from floppy to floppy on the 8 bit 1050's to clean up the data and make it reliable on the 8 bit after transfering it over. Why would anyone want to go PC to 8 Bit is a mystery I've been migrating everything to burn to a CDR for safe keeping to run under emulators years from now :) myself. 1050's and 551's will eventually all burn out, die or run out of belt drive rubber bands.

Actually most of the Atari 8 bit software has literally been moved into what is often called "Tentatively Public Domain" for reasons of non-enforcement of copyrights over the past few years.

I've seen many an FTP and HTTP site with loads of 8bit software titles nicluding the 12 Adventures by Scott Adams such as Ghost Town and all that ancient obsolete stuff.

Most of the value is for those too people lazy or slow to find what they seek on the net or for the simple nostalgia of having something they wanted years ago and never had (Then when it was of value) and therein lies the only real value left to most of it.

Me I want to find a working MIO to read what is on this old 20 Meg SCSI drive? Was there any intersting source code on it hmm the world may never know... Alas 20 year old computers are tough to find stuff for.

Good Luck!

If software copyrights are not defended by the owner for many years as
is the case with the 8 bit software for some time now then it
literally enters the Public Domain.

Add to this the fact that nobody owning those copyrights has made any
money for many years on their software sales and you have another
reason why they would not bother to legally defend the copyrights
either.

To sue they would have to prove a financial loss which would be a HUGE
joke on 8 bit software trying to prove that you were robbed of
millions in profits by this theft of copyrighted software.

Very humorous if you think about it. Who in their right mind would
spend legal dollars even trying to push this into an actual court?

Only fairly big companies with big bucks (many thousands or Millions)
being stolen will usually find it worth their while to invest in legal
actions to recoup losses on Software (C) theft.

Smaller companies and CERTAINLY anyone holding rights to Wizard of Wor
(laughing) or Zaxxon for the Atari 400 will have had no recent sales
and its NOT because anyone is actively stealing their software hehehe.

Nuf said - Case closed.

I have always been told that
8 bits is a Byte.
16 bits is a Word.
32 bits is a Long Word.

I don't know what 64 bits is.

There is a cross-hair which allows you to destroy the bombs.

Press the space bar to turn it on and off.

Use the joystick to move it (when it's on).

I don't think I ever figured out how to actually fire it once you've aimed
it. Maybe someone else has more info about the game.

I'll do a search to see if I find anything. I already tried to search
for "koronis rift" and came up with the doc file and an "historical"
Lucasfilm page telling about their old games.

> > BTW what should happen when you've cleared rift 20? I managed to kill

I destroyed it with the RT robot. Trying to loot it kills the robot
(it freezes in mid-air) but the base goes bang. Is this what I am
supposed to do?

> There's also a table about the "chroma quantisation":
[......]

Hmm....I need to check this more in detail by looking at the damage
that is inflicted. I'll grab some different shields and see how well
they protect against a given saucer.

> There is a logical pattern behind which laser is used by the saucers on each
> Rift. The colors of the saucers also have a pattern to allow the player to
> select the correct laser early.

The docs said this, but I never took it very seriously. I think I
should try to play the game writing down the color of the saucer and
its weapon for every rift, to locate non-randomness.
Does it say that the pattern is fixed or it "adapts" to the player?

> The article mentions a special way through the game, which includes only ONE

You are supposed to destroy it. The article doesn't say how, but it
ALSO mentions that the RT can be used as a bomb... Hm.

> Does it say that the pattern is fixed or it "adapts" to the player?

I think it is fixed.

It's four pages with some of the maps, which are quite big. Maybe I'll
get around translating it on the weekend.

Hi James,

> I have always been told that
> 8 bits is a Byte.
> 16 bits is a Word.
> 32 bits is a Long Word.

> I don't know what 64 bits is.

It would probably be a long long word (GNU C terminology) or a quadword (Intel and Motorola terminology). Intel-minded folks would refer to a 32-bit quantity as a double word. PowerPC adepts on the other hand call 64 bits a double-word, since this processor has, and always has had, 32-bits words.

I guess the reason 8-bit people usually refer to 16 bits as a "word", is that there is a perfectly good word for 8-bit quantities. But from a hardware perspective, I'd say the 6502 is an 8-bit processor, handling 8-bit words.

Even your statement of 8 bits to the byte is perhaps overly optimistic. In high-quality specs, 8 bit quantities are called "octets" (for example, internet RFC's). A byte is more like the smallest amount of data the processor can fetch from/store in memory, which just happens to be 8 bits on most machines. There used to be exceptions though. For precisely this reason, the C header file "limits.h" defines a macro CHAR_BIT, that holds the number of bits to the byte.

All in all, what's in a word?

Regards, Sidney

PS. we could of course agree to disagree, but you 16-bit people should really go to comp.sys.atari.16bit then ;-)

A modem (well, duh!) and one of numerous BBS programs.

I did a search for the keyword "bbs" on XL Search and got over 500
matches. Not all of them are relevant (for example, some matches
are documentation, some are terminals, etc.), but it's a good start.

You'll notice some Atari FTP sites have entire BBS directories.

Good luck!

PS - XL Search is at: http://www.newbreedsoftware.com/xlsearch/

heh, I used to love these old BASIC program books. There were a fair few Spectrum specific ones, but I also came a cross a few like the one you're hawking, which had programs in some obscure BASIC that no home computers actually seemed to use, so you had to port them 'on the fly' as you typed them in. Oh, nostalgia...

i remember typing in STRTRD (star trader) at a decwriter-II attached
to a decsystem-10 via a 300-baud acoustically coupled modem and
translating from HP3000 basic to DEC basic as i went. i submitted the
final LIST output as homework for typing class :) this was in '77 or
'78, i think.

This is factually wrong, Hasbro has bought the rights to Atari game titles
and has released updated versions of them. My son snagged the issue of
Computer Gamer<?> that had the rankings, but I know Hasbro was listed as one
of the top ten grossing computer game companies.

Try coming out with a W98 version of Frogger for example and see how Hasbro
likes it. In their case, I really doubt if they care about older games, but
they wanted to get the rights to current and future updates.

Since Hasbro paid serious money for the copyrights of old games and
apparently made millions off of them, this may change everything.

I don't really care since I am not involved in any manner, but lets say you
are the holder of several old time copyrights like Zengi or Serpentine.
After seeing what happened with Hasbro, I would be knocking on their door
trying to peddle the copyrights. It may take a while for people to realize
this, they may never realize this, but it does seem like it will happen.

Super! But much worse were the machine code programs that had to be typed
in as seemingly endless hex listings. As least with the Basic, every now
and again you could stop and run it to see what you had done so far.

Hurray for the coverdisk!

I thought you'd like to know about a cool newsite I just
found. It's the easiest way to shop for anything you
want online - and you can save a lot of money! I'm
sure you've tried to find things with the search engines,
so you know what a hassle that is. But not anymore.
With this new site, you can quickly find ANYTHING,
anywhere in the country - and you get really good prices.
Now shopping online is as easy as finding things in your
yellow pages. The site is free, and you can find products
and services anywhere in the country.
Here's the address: http://andersons.sbn.com
I love this site, and I'm sure you will too. Try it out, and
let me know what you think!

I would like to compile a list of 5200 games that "Glenn" ported to the Atari
8-bit computers. Here are the ones I know of so far:

Berzerk
Crystal Castles
Gremlins
Jr. Pac-Man
Space Dungeon
Vanguard

I have seen Xevious on the 8-bit and think that was a 5200 port as well.
Does anyone know what else he ported?

What did he do with games that used the 2nd button, or parts of the key pad?
Did he map those keys to the 8-bit keyboard?

Yea, the video minotor has a bnc jack for video in, but a simple bnc-to-rca adapter I got at radio shack worked. AND speaking of my 800XL, I found my once precious "mapping the atari" book, found the pinouts, made ANOTHER trip to radio shack picked up a 5 pin DIN connector and an audio-video patch cable, and made a cable that works great. I used the composite video pin on the 800XL, and then the audio pin. plugged it in and it works like a dream :) I was thinking of modifiying the 800XL, say soldering wires directly to the pins on the back of the monitor jack inside, and putting a dual RCA jack above it thru the case, so if I ever lose the home made cable, I can use a normal rca audio-video cable, but really dont want to drill holes into it *grin*. thanks to all who e-mailed me with info! I appreciated it!

The copyright doesn't cover just the Atari 8-bit versions, but also the right create derivative works. Hasbro is making a lot of money on the copyrights they got with their purchase of Atari.

> To sue they would have to prove a financial loss which would be a HUGE

By convention and usage, the 6502 manages 8 bit "bytes" and all (to my knowledge) of the Atari assemblers and 6502 manuals refer to 16 bit values as either "words" (Lo byte - Hi byte) or "double bytes" (Hi byte - Lo byte).

BASIC Computer Games
David H. Ahl (Creative Computing), 1978, 183 pages.

The classic of all classic BASIC games books. I've spent hours with this one back in the 80's and would never consider selling my copy, but I happened to come across a second copy. The illustrations throughout the book are great! My all time favorite games from this book are: Animal, Hammurabi, Life, Life For Two, and Lunar LEM Rocket, Orbit, 3D-Plot, and many others.

But of course the source for the all-time greatest game is contained in this book as well: SUPER STAR TREK. This is the original of originals. Converted directly from Mike Mayfield's HP2000C source code, which was the "standard" Star Trek in 1973, that was put in the HP contributed program library and onto a number of HP Data Center machines.

here's the header file from the extensive full source code listing in the book:

```
10 REM SUPER STARTREK - MAY 16, 1978 - REQUIRES 24K MEMORY
30 REM
40 REM **** **** STAR TREK **** ****
50 REM **** SIMULATION OF A MISSION OF THE STARSHIP ENTERPRISE,
60 REM **** AS SEEN ON THE STAR TREK TV SHOW.
70 REM **** ORIGINAL PROGRAM BY MIKE MAYFIELD, MODIFIED VERSION
80 REM **** PUBLISHED IN DEC'S "101 BASIC GAMES", BY DAVE AHL.
90 REM **** MODIFICATIONS TO THE LATTER (PLUS DEBUGGING) BY BOB
100 REM *** LEEDOM - APRIL & DECEMBER 1974,
110 REM *** WITH A LITTLE HELP FROM HIS FRIENDS . . .
120 REM *** COMMENTS, EPITHETS, AND SUGGESTIONS SOLICITED --
130 REM *** SEND TO: R. C. LEEDOM
140 REM *** WESTINGHOUSE DEFENSE & ELECTRONICS SYSTEMS CNTR.
150 REM *** BOX 746, M.S. 338
160 REM *** BALTIMORE, MD 21203
170 REM ***
180 REM *** CONVERTED TO MICROSOFT 8 K BASIC 3/16/78 BY JOHN BORDERS
190 REM *** LINE NUMBERS FROM VERSION STREK7 OF 1/12/75 PRESERVED AS
200 REM *** MUCH AS POSSIBLE WHILE USING MULTIPLE STATMENTS PER LINE
205 REM *** SOME LINES ARE LONGER THAN 72 CHARACTERS; THIS WAS DONE
210 REM *** BY USING "?" INSTEAD OF PRINT WHEN ENTERING LINES
```

In addition to full instructions and a sample run, is an excellent discussion on the origin of the quadrant nomenclature adopted by the game.

From back cover: "101 imaginative and challenging games for one, two, or more players -- Basketball, Craps, Gomoko, Blackjack, Even Wins, Digits, Bombs Away, Horserace. Simulate lunar landings. Play the stock market. Write poetry. Draw Pictures. All games come complete with step-by-step programs and sample runs. All programs run on Microsoft 8K Basic, Rev. 4.0. Basic conversion table included. David H. Ahl is the founder and publisher of Creative Computing."

Whoa! Thanks for the tip. I think I'll have to plan another trip to
Toronto in the very near future. :-)

Actually, I may be going down there next Tuesday evening for my users
group meeting so maybe I should just head down earlier and go
shopping. :-)

I wonder what the introduction of Unicode characters will do to this.
Perhaps, in twenty years time, the smallest unit-of-computation will be
16 bits. With low-priced memory, there would be little reason to retain
8-bit bytes then, except to support legacy code.

Quite a shame really, this Unicode thing, when at last the whole
computing community seemed to do the impossible: reach a de facto
(ASCII) standard :-)

> There are RISC chips (e.g. early ARM processors)

Good point. My definition goes out the window... These questions of
"definition" are tricky indeed.

I respectfully disagree. When it comes to writing standards, it's hard
to be overly precise. As long as there is the possibility of discussion
about bits/byte and bits/word, I'd hope the standard-writing people keep
on using the word "octet" instead of "byte". In practice, this would
mean putting something like

```
#include <limit.h>
#if (CHAR_BIT!=8)
#error Go buy a normal computer!
#endif
```

into header files, which would solve (or at least intercept) most
potential problems.

Hi people,

Just out of curiosity: does anybody know a reason why the ATARI
character set definitions (the bits that make up the character glyphs)
are not in ASCII order? I cannot think of a good reason for this. I
think it would be entirely possible to rewrite the OS in such a way that
the character defs _do_ conform to ASCII order, and save a few dozens of
bytes in the process.

Regards, Sidney

If you wanted efficiency in the OS that way, you would have to give up
efficiency in the hardware.

Consider the graphics modes where you get a restricted character set of 32
(or is it 64?) characters. I believe you get the first 64 (or 32)
characters from the hardware ordering. If you change a bit in memory you
can get the second 32 (or 64) characters.

Now say you made the hardware use the ATASCII order. Either the small
character sets would consist of useless control characters and no letters,
or you would have to make a more complicated ANTIC that could take
characters out of the middle of the set.

It's 64, if memory serves... And you are probably right about this being
the reason. Thanks.

Source record: 47308

Lonny Pursell wrote:

> Don't suppose anyone has the original sources to Turbo Basic XL?

Unfortunately I don't. I used to have copies of the original article that appeared in the German "Happy Computer" magazine, but I lost them... Does anybody have the original magazine or copies? It may be nice to have these scanned and put on the Internet, as Turbo Basic was (in my view of things) such a breakthrough program at the time.

I believe it was in the December 1985 issue; the compiler was published in a special issue of Happy Computer, early in 1986 I think.

Strange thing is that Frank Ostrowski, the author of TB/XL, doesn't seem to have a net-presence, according to AltaVista.

I've had trouble getting some things to work with XF2000 although it
is one of the best as far as ease of use but alas is less compatible
for some reason.. Changing disks on it is EASY just right click and
your menu comes back up then switch disk image files and click
continue works like a charm. Its especially nice with 16 meg HD image
files which give you loads of 8 bit space like a SUPER MIO or black
box.

I am myself seeking MYDOS 4.6 which I am told by a well known source
should be out very soon and support 48 meg partition files!?
Anyone else hear this?

>
>PS: pop quiz: what microcomputer featured a 19.000-bit processor?

I see many people have missed the point. Unlike some in here I never
claimed to know the definitive criteria of what sets the "word" size
on the 6502 platform. I took a stab at it, but that was just a guess
and I phrased it as such. Hell, my guess may even be right, or not!

If you want to know what my guess was you'll have to back track a couple of message cycles. But it doesn't matter anyway. See below for what DOES matter.

What I DO KNOW, is that all the official and even unofficial literature that I have ever read about 6502 assembly dictates a word as being 16 bits in size. Not 8 bits. Not 4 bits. Not chunky bits or Kibbles and bits. I'm talking about major and respectable sources included in that. Bill Wilkinson says 16. Lance A. Leventhal says 16. Everything else too, until here and now in this newsgroup where history is trying to be re-written according to the notions and rationalizations of certain people. I AM, and HAVE ALWAYS BEEN (at least long before we all were on the internet and certainly this thread) aware that the 6502 has 8 bit registers, an 8 bit data bus and a 16 bit address bus. I am not confused upon those concepts at all.

Unlike seemingly a few in here, I do not suffer from a denial of reality, just because I do not know for sure the original purpose of calling 16 bits a word on the 6502 and having my best attempts at rationalizing it not fit right with that. My rationalization is in AGREEMENT with those that say a 'word' should be defined as 8-bit in 6502 assembly. I just happen to realize that it is still 16 bits just the same. As it happens, my guess as to WHY it is 16 bits, falls very much into line with what someone else (sorry I forget who exactly) said in here about 8 bits being too puny for many workable number sizes, and the fact that addresses (which are 16 bit) are very often used in assembly instructions. You cannot go through very much 6502 machine code without hitting upon instructions that are accompanied by 16 bit addresses. Sure, you can have some incrementing or shift instructions, but before long you are blasting out references to addresses. Unless you are in page 0, those addresses are 16-bit. With so many 16 bit items in 6502 assembly being treated as a unit, it is my guess that is why 16 bits is the chosen word size. It is an arbitrary, or at least flexible choice. In other words (catch the pun? hehehe) 'word' size is more a function of the conventions of coding in machine code or assembly than it is the actual parameters of the hardware. In my estimation at least. I am not stating this as a known factual reason for it being the 16 bits THAT IT IS.

I tried making one of those cables and it didnt work. I wound up
using a 5.25 inch floppy drive purchased for $2 on my PC to read the 8
bit floppies. Works great just use the ATARIDSK program to read them
and it only reads the FRONT sides because IBM floppy uses teh little
round timing hole which 1050 did not use.

Source record: 47319

Hi Everybody!
I had downloaded the NASM - CrossAssembler for the ATARI ST, but I can't use it!
1.) It should be MAC65 compatible. I never used MAC and therefore I didn't know
anything about it's features or Sourcecode _Layout_!
Is there a MAC65-Manual online available?
2.) The two demosourcecodes will not be assembled! The assembler claimes he can't
find the include-files. I set the EnviromentVariable correctly (MiNT)
and I also tried
the "-h" option.

Did anybody manage to use the NASM without Problems?

Is there another CrossAssembler available? The NASM is just a one-Pass-ASM, so that
you are restricted in the use of Lables.

Salut,
daniel

Sort of... The most used characters on the 8-bit are the letters A-Z
(caps), punctuation and numbers then the lowercase.
BTW there are 3 sets of numbers. the Internal Code (the list in
question here), ATASCII, and key code. The keycode set is what I like to
use in BASIC programs for single key press menus (Peek (764)). very
useful. I rarely ventured into the I-Code. Not necessary unless you are
redefining the characters.

I don't think 8-bit bytes will ever really disappear - they're really quite
ingrained into current systems. This is why I think the "octet" brigade are
barking up the wrong tree - not that there's anything wrong with calling
bytes "octets" (indeed, the French speaking world doesn't do anything else
as far as I can see); it's just that it's unrealistic to suggest that
anyone would implement a new system where bytes don't have eight bits.
At least 99.9% of the operational computers on the planet are systems on
which "byte" was defined as 8 bits. And most people (especially those in
this group, many of whom learned to program on Atari 8-bit micros - I know
I did ;-)) were always taught that 8 bits = byte = 8 bits. (and also
4 bits = nybble [not "nibble"] = 4 bits).

Besides, Unicode is a *good thing*. Well except for the fact that they
have too many different encodings ;-).

> "definition" are tricky indeed.

Especially with things like this. I think it's mostly convention (and
in particular convention local to particular platforms). Your definition
makes sense - but so do many others. There aren't any standards governing
the sizes of "byte", "word" et al. - though popular convention dictates
that byte is eight bits (which makes 8-bit bytes a de facto standard -
of course, people are free to ignore standards, especially de facto ones,
but at their own risk), then word and any further derivatives are *usually*
multiples thereof.

> potential problems.

Ah, but you're confusing the standards world with the real world ;-).
One of the primary things for the standards people is that they have
to be consistent, and they initially started using "octet" because of
some machines with odd-sized bytes. Hence they now have to stick with
that decision - but it doesn't mean that the rest of us should ;-)

Yes, the C standard says something about the size of a "char" being one
"byte" - and it does not define the size of a "byte"; but IMHO this
is a mistake and the word "byte" shouldn't have been used in this way.
Bytes *by convention* nowadays are eight bits. Frankly, the C language
is in dire need of some fixed size data types in any case. The variable
sized types are great for "ordinary" programs, but they're useless for
saving binary files or sending messages across networks in a machine
independent way.

The "octet" thing only really irritates me when it's used outside
the standards world and only then because the actual reason for it is
rather obtuse and isn't actually relevant these days anyway. Back in
the '70s it may have been necessary, but the machines that caused the
problem aren't even available any more, so "byte" is no longer

confusing.

I dispute that we should change popular convention and use "octet" just because of a very few obsolete machines that had bytes with other than eight bits. The standards people *should* continue to use "octet", though, because it is best for them to be consistent with their previous documents, many of which had to use "octet" because they were intended to cover machines with 4 and 9-bit bytes. But as for the rest of us, I think >80% of people would agree that "byte" for all practical intents and purposes means 8 bits.

No-one's ever likely to create another machine with a non-eight-bit byte anyway - that would just be unnecessarily obtuse.

Regards,

Alastair.

I think most of us are sick of it. But when someone states something as fact
that is absolutely wrong, it needs to be corrected before others (who aren't
aware of the facts) spread the inaccuracies as truth.

Since I am from Germany and do own the Happy Computer magazines and
"Atari Sonderhefte 1+2" I could do you a copy of the TB articles ...
When searching for Frank Ostrowski, maybe a search string like GFA Basic
or Omikron Basic (both for the ST) helps. As fas as I know, he wrote one
(!) of these Basics shortly after TB... Greets - Andreas

Michael,

I still have a few NEW power supplies in stock for the 1050 drive. Price is $12 each with Priority Mail shipping INCLUDED. Email me at s.winick@worldnet.att.net if interested. I may also have a used power supply for the 1010 recorder lying around, but will have to check the back room to verify that if you're interested.

You may want to try using ST Xformer, the ST Atari 8 bit emulator, with one
of the 8 bit assemblers that are available. The disk based version of MAC/65
is freely available and John Harris has put his MAE assembler at umich
archive for download.

Just set the filter on your newsreader to killfile anything with copyright
in the subject.

Some things like Christmas, The Wizard of Oz, good sex, and copyright
debates just never seem to get tired for some people.

It will never stop, it will always be here, death, taxes, and copyright
debates.<grin>

But some people like Bob Wooley have suggested alternative methods for
handling software i.e. no software should be given legal protection unless
it is distributed with the source code which would be a similar situation to
how patents are granted. I know I argue for a shorter term for software
protection, something like 7 years from commercial release would be
appropriate. Personally, I don't think software should even be covered under
the copyright laws.

Thing is, we are still in the stone age of software. Kind of like arguing
over what is going into the Constitution or Bill of Rights: Trandsends law
and becomes a combination of religion and politics.

Things will change, but not until the laws are changed to reflect reality a
little better.

They are both 9V AC ~31 watts IIRC. The cassette could probably get away
with a less robust transformer then the 1050, but if you can find any 9V
transformer that delivers around 3 amps you should be ok.

Kind of funny though, I was playing golf with some Intel employees back in
the 80s and the topic of the 8088 came up. I talked about it as an 8 bit
processor, and they corrected me saying it was a 16 bit processor. I pointed
out to them that the Intel Data Sheets called it an 8 bit processor and they
replied, "Oh? We will have to change the documentation then."

I was flipping through a really old text on the 6800 micro, copyright 1975.
In it Motorola defines micros by the width of the buss it uses for data.
Never talked to a Motorola engineer, but I imagine they changed that
definition when they came out with the 68008<or was it 68010? 680xx anyway>
with an 8 bit data buss.

The micro manufacturers can't even get it right in their own shops so it is
hopeless here.

Yes, Frank went on to code GFA-Basic. I have the entire Turbo Basic XL
article from "Happy Computer" but it is not the source. It is a basic
loader that creates a binary. Someone from Germany kindly photocopied the
entire thing and sent it to me. That was darn nice. However I seek
the actual assembler source code. One can disassemble it but that
is alot more work so finding the sources would be nice.

I was talking to someone on IRC who thought they heard at one time
(a very long time ago) that possibly one of the guys who was involved
with an 816 mod to the XE had the actual source code to Turbo Basic XL.
Would of been cool to see it recoded for the 816 mod if that were true.

My 2 cents:

I too have always known a WORD to be 16 bits. I have also heard it
called a CARD. 8 bits is called a char, unsigned char, or BYTE. I
have never heard of a WORD being 8-bits.

Regarding the other message: If my memory serves me correctly an 8bit
processor is not called an 8bit processor because it handles 8bits
best. Its called that because it can only deal with 8bits at a time.
Even though its addresses can be 16bits its still handling that 16bit
address as two separate bytes. The above comes from what I read in a
Michael Abrash programming book.

Yuck, store-bought tapes being used as blanks?!? I guess if
you are the type to listen to tapes, the quality of the audio
isn't a concern for you ;-)

Oh - and we are not talking about "cut-out" tapes or records...
Matt has a cart that SumGuy actually "ruined" the label by
touching it with his fingers as he inserted it into the cartridge
slot. I hate that!!

Hold the cart by the sides folks - you'll be surprised at the
re-sale value if you never touch the label with your greasy
cheezy poof ridden paws =P

Source record: 47341

Hi,
I have the following items for sale:
-2 Macinotsh Pluses - one of them has a non working floppy drive, other than that it is in perfect condition and the other one has a bad picture tube (you have to let it warm up for 5 - 10 mins before it will come on), other than that, the second one also works perfectly. Both come with the original Mac Plus keyboard and mouse and the first one to get sold comes with a power cord (sorry I don't have 2) and some copies of system disks for the Plus. Any more questions, just e-mail me. You can see a pic of one of the Pluses (they both are actually very similar in condition) at:
http://members.aol.com/kjj58/MacPlus1.jpeg
I am asking $25 each for these plus shipping.
-Epson MX80FT Dot Matrix Printer - I have no clue if this printer works or not, I think it is for non-Apple computers anyway. It has not been tested whatsoever, so I can't guarantee anything. E-mail me if you have more questions. You can see pictures of it at:
http://members.aol.com/kjj58/EpsonMX80FT1.jpeg
http://members.aol.com/kjj58/EpsonMX80FT2.jpeg
http://members.aol.com/kjj58/EpsonMX80FT3.jpeg
I am asking $10 plus shipping.
-Atari 1020 Color Plotter Printer - this unit is also totally untested and it is for use with Atari's 8 bit computer series. This is for the printer only, no power adaptor, sorry. If you have any questions, e-mail me. You can see pictures of it at:
http://members.aol.com/kjj58/Atari10201.jpeg
http://members.aol.com/kjj58/Atari10202.jpeg
I am asking $5 plus shipping.
Thanks so much! I am flexible with the prices though if it comes down to a few dollars here or there.
-Matt

Hey!!! what is wrong with good sex???????

I know a guy, the first program he ever wrote on his 800xl was about
sex. I won't go in to details here.

434. Atari 800, PAL/NTSC 50/60Hz ??

Newsgroup: comp.sys.atari.8bit
Date: 2000-01-14 00:00:00 UTC
From: cozy@spamfilter.stormdragon.com
Message-ID: <387edccb.633198@news.lin.foa.se>
Source record: 47344

Hi
I once had an Atari 800 (not the XL) and now I want one again. I see a lot of 800's for sale on Ebay and in other places . The problem is that they always are of the American type (or maybe tha problem is that I live in Sweden =).
Anyway, the differences between the machines is the television standard NTSC/PAL and the power supply 110-60Hz/240-50Hz.

Now to the questions about NTSC/PAL:
If I buy an American Atari 800....
-would I get a good picture on a PAL-system TV?
-would it be possible and not to hard to change it from NTSC to PAL?
-does it have both a NTCS and a monitor connection?

And some questions about the powere supply:
-What is the voltage into the computer?
-Is it AC or DC into the computer ?
If it is for example 9V-DC into the computer, then I could easely get such a power supply where I live.

If it's AC (60Hz) what would happen if I plug in my own power supply with the correct voltages but with 50Hz instead of 60Hz?
If there is any problem, would it be easely fixed? How?

Thanks

>
>NOT TRUE
>
Yes it is true. It's extremely simple!

Hasbro would not have the slimmest chance of winning a lawsuit or
enforcing a copyright on some physical copy of Atari PacMan (C) 1983
for the Atari 800 because someone found it on the internet and was
playing it on whatever say some PC 8bit emulator.

You know it, I know it, they know it and I'm sure Hasbro of course
knows it.

This in fact defines what is free and public domain. Copyrights
intent are to enforce the right to profit on an item in that

"you can have it but you must pay for it and buy it"

In the case of these ancient programs it invalidates the Copyright
because You CANT buy these old titles anymore, they are not SOLD in
that format anymore and this is where you cant tell someone to throw
it away because they didnt pay for it because it CANT BE BOUGHT
anymore and therefore nobody lost any profit and could NEVER make a
claim to having been robbed of profits because there is now financial
LOSS!

The Fact is Hasbro certainly hopes very much that people keep an
active interest in these old titles because it makes them more likely
to buy their new Playstation or N64 versions of them. Of course
nobody has the rights to make the new Playstation version of PACMAN
HASBRO owns the copyrights to the name and this was clearly their only
concern and area which will be defended if infringed upon.

Only a determined picker of nits would even waste bandwidth trying to explain or insist that these hundreds of web sites posting all the old 8 bit programs for years now are all about to be arrested or sued. You know thats a ridiculous assertion so why make it?

Thats quite nearly the most preposterous thing I have ever heard!

End of thread I will not reply to it again. Thank you and I'm sorry for you and anyone who believes you - how awful to live in fear of retaliation for trivial things and having to live with yourself always sweating the small stuff so seriously.

To never pick the flowers..

436. Atari sticks on PC/ Ostrowski/ (Speedscript) source

Just a note to let everybody know I got my Atari joystick adapter. Thanks Emmanuel! (And others for helping me with my search).

I can recommend it to everyone. For the first time, I can play my favorite Atari games on my PC with the same "feeling" as a real 800XL. I mean, have you ever tried playing Bounty Bob Strikes Back with the keyboard? (OK, I'm using the cheats too).

Apropos Ostrowski: I used to have that German "Happy Computer Sonderheft" magazine too, but to be honest, the Turbo Basic articles weren't *that* informative, everything from the articles is available on the 'net (translated into English and all).

It *did* contain another Ostrowski masterpiece, however: "TwoMaze", a little PacMan-clone with alternating mazes, for two players, in 4Kb!! And thanks to Emmanuel, we can play it with two CX40's on a PC! :-) (Try it at level 12!)

And a final note on "source code": The only source code I ever typed in was "SpeedScript" by Charles Brannon (from Compute! magazine). Anybody wants it? Trade you for the Ostrowski code :-) (Seriously, I'll email it to anyone who wants it).

Richard

atari@benjamin.net or bensmith@teleport.com instead of NewsGroups as I
find it hard to keep up with NewsGroups.

NOW! For a limited time offer! Buy an Atari ST Computer and receive,
your choice, for ***FREE*** an ST Color or MonoChrome Monitor. That's
right, you too can have a Color or MonoChrome Monitor, made by Atari
when you buy an Atari ST Computer. Thats an SC1224 or an SM124 Monitor.
Customer pays shipping. While supplies last.

e-mail: atari@benjamin.net

Click for WebSite!

I've added more and will be adding more Hardware, Software, Books and
Accessories for Classic 8 Bit and Atari ST. So checkout what's new on
my WebSite. In Fact, check it regularly as my Catalogs are updated
regularly. Customer's are served, first come, first serve! I have 6
different Catalogs, and my SoftWare Catalogs are my largest. They have
the biggest Byte Count. You should see my inventory! I have TruckLoads
of HardWare, Boxes & Boxes of Software & Libraries of Books & Reference
Material for the Classic Atari 8 Bit & Atari ST! And remember, if you
can't come see me today, come see me tomorrow!

also, if you live in Portland, Oregon, interested in Atari and want to
meet with other Atarians. Read the Ad near the bottom of this message.

FREE Catalogs for Classic Atari 8 Bit & Atari ST Computers! Hard-
Ware, SoftWare, Books & Accessories! View Atari Catalogs on the Web at
http://www.atari.benjamin.net And Jump to my FTP site linked to my Web
Site so you can Download Free Catalogs or FTP directly to my site at:
ftp.teleport.com/vendors/bensmith/ If you can't get Catalogs that way,
Feel free to Request catalogs through E-Mail. Really, it's not an
inconvenience. I do ask that you specify Atari 8 Bit, Atari ST or Both!
Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail.
Please let me know if I can attach text files to your E-Mail. Catalogs
are just regular ASCII text files so you can download them into your
text editor and view them, edit them or print them out! It would make
things easier for me if you take my Catalogs, load them into your text
editor, delete what you don't want and E-Mail me the rest! To expedite
things, include your complete Mailing address so I can figure your
Shipping/Postage & Handling. I'll be back after the weekend.

If you have an Atari and live in Portland, Oregon. U.S.A. or vicinity, you are cordially invited to attend a Meeting of the Portland Atari Club. You don't have to be a member to attend. Now we've moved our meeting to a new night. Same Bat Time! Same Bat Channel! We meet the 2nd Thursday of each Month. Our Next meeting will be Thursday, February 10th, 7 pm at the Pizza Baron at 2604 S.E 122nd Avenue in Portland, Oregon. We're trying to rebuild our club so we're looking for Atarians who wan't to get involved in supporting other Atarians. If your interested, call Ben at (503)256-9974 and by all means, come to our meetings on the 2nd Thursday of the Month. For more info, surf the Web@

http://pac.pdxweb.net

e-mail: atari@benjamin.net

For more information or directions, please call our Vice President Ben Smith at (503)256-9974 See you there!

You should know I regularly add more Atari stock items to my catalogs and this weekend is no exception. A list of my new ST Software I just added to my Catalog are listed below. In case your wondering why my Catalogs (below) are formatted to 38 Columns. They are made to be compatible with the lowest common denominator. Also known as the Atari 8 Bit. Once the Classic Atari User converts the Carriage Returns to Atari 8 Bit.

> that they always are of the American type (or maybe tha problem is
> that I live in Sweden =).
The problem can be solved by taking a look at the ebay in Germay (yes there is a german ebay) in germany the Atari also sold well just as in the US. I have had a look there today and there was a lot of atari 8bits for auction there. If you don't have to buy the 800 there is a auction page in Norway (where I live :-) at www.dinside.no you must understand a bit Norwegian, but since you are swedish I guess you can figure it out. Problem is that the only ones that sold well in Norway was the XE........

> Anyway, the differences between the machines is the television
> standard NTSC/PAL and the power supply 110-60Hz/240-50Hz.

Power supply can be bought from Fritjof Arngren Electronics in Oslo (they have a branch in sweden also) its a 100watt converter.
No problems to use it, I have bought diskdrives/tape drives from the US with US powersupply. It works great.

> Now to the questions about NTSC/PAL:

You will get a black and white picture if your television supports 60hz or more (all new TV's do), monitor connection on 800 is also NTSC so again it will be B/W on pal monitor.

Thanks for your answere.
I have been looking for Atari at the Ebay in Germany but I tought that
there where none because I never get anything listed when searching

for Atari. This time I read what the message said (should always do that) and it said that there where to many hits and that I should try to be more specific. I then tried "Atari 800" and was rewarded with 2 hits (better then nothing).

I will loog at the site in Norway also.

Thanks again

I guess these terms were defined long ago, and certainly predate the Motorola 6502. Since I come from the mainframe world. I'll offer this as a definition of the word, word. It is taken from the IBM Vocabulary for Data Processing, Telecommunications and Office Systems, which is a compilation of terms and definitions.

word. (1) * (ISO) A character string or a binary element string that is convenient for some purpose to consider as an entity. (2) * A character string or a bit-string considered as an entity. (3) In System/360 and System/370, 32

bits or 4 bytes. (4) In System/7, 16 bits or 2 bytes. (5) In COBOL, a string of not more than 30 bytes... (6) Synonymous with fullword. (7) * See alphabetic word, computer word, doubleword, halfword, index word, instruction word, numeric word, parameter word, reserved word.

word boundary. Any particular storage position at which data must be aligned for certain processing operations in System/360 and System/370. The halfword boundary must be divisible by 2, the fullword boundary must be divisible by 4, the doubleword boundary must be divisible by 8.

* computer word. (1) (ISO) A word stored in one computer location and capable of being treated as a unit. Synonymous with machine word. (2) See also halfword.

* doubleword. A contiguous sequence of bits or characters that comprises two computer words and is capable of being addressed as a unit.

* halfword. A contiguous sequence of bits or characters that comprises half a computer word and is capable of being addressed as a unit.

* American National Dictionary for Information Processing.

In the IBM PC, a word was two contiguous 8-bit bytes. I don't remember much about the 6502, I never even got around to opening the MAC/65 assembler I bought, and all my Atari books are in boxes for the last ten years. But I think the key in the definition of word is, "...being capable of being treated as a unit." and, "...is capable of being addressed as a unit."

Regarding how many bits are a byte: As far as I'm concerned, a byte is 8 bits. There may be a bit used or a bit added for parity, but who cares, unless you're a machine. Again, from the IBM Vocabulary for Data Processing, Telecommunications and Office Systems:

byte. (1) * A binary character operated upon as a unit and usually shorter than a computer word. (2) The representation of a character. (3) In System/3, System/360 and System/370, a sequence of eight adjacent binary digits that are operated upon as a unit and that constitute the smallest addressable unit in the system. (4) In System/7, eight adjacent bits plus a parity bit. (5) * See n-bit byte.

* n-bit byte. (ISO) A byte composed of n binary elements.

* American National Dictionary for Information Processing.

Actually, all you need is one example to prove your theory doesn't hold and
I have several.

Recently<in the last year> OSI forced a web site that was distributing
Ultima IV to take it down. AFAIK, it was because they wanted to use it on a
cover disk as a freebie and for promotional purposes themselves.

Sierra recently re-released Betrayal at Krondor on a cover disk to promote
their latest game in the series.

You can go to Fry's today and buy a copy of Ultima compilation, 1-8.

The situation is exactly the same as we had in the movie and early
television industries. No effort was made to preserve early films or
television shows because it was thought that having been seen, no one would
want to watch them a second time.

For instance, all those "I Love Lucy" reruns you see? story goes something
like Desi Arnez asked for the tapes of the shows at the time they were being
made, and was told if he reimbursed the studio for the cost of the tape<they
were going to record over the previous shows> he could have them.
>
> This in fact defines what is free and public domain. Copyrights
> intent are to enforce the right to profit on an item in that
I would predict as the net become more commercialized, yes you will be able
to get old programs for free, but it will be from whoever holds the current
copyrights such that they generate hits.

Academic argument since free will be free if the copyright is not defended
or if it is defended and you just have to go to the copyright holders web
site or get the material as a cover disk freebie.

For instance, the B@K came with a demo of Betrayal at Antara and IIRC,
opening any help would auto start your browser and point you to the Sierra
web site where you were hit over the head with adverts and sales pitches.

Well, what would you call someone such as yourself who makes statements that
are completely inaccurate or missleading?
>
> Thats quite nearly the most preposterous thing I have ever heard!
>

I have a vested interest in intellectual property. I am currently on just
over 50 patents and the concept of me losing my rights to the patents
because I don't stop every idiot that decides to infringe on my inventions
is preposterous. I may not be able to hunt people down and sue them, but
that doesn't make it legal! Sheesh!

> End of thread I will not reply to it again. Thank you and I'm sorry

> >NOT TRUE
> >
> Yes it is true. It's extremely simple!

No, it's not. Copyrights are valid even if they aren't defended. In fact,
with the duration of copyrights being extended fairly often by Congress,
it's likely that copyright protection will be extended indefinitely.

You may be thinking of trademarks, which can be lost of not defended.

> Hasbro would not have the slimmest chance of winning a lawsuit or
> enforcing a copyright on some physical copy of Atari PacMan (C) 1983
> for the Atari 800 because someone found it on the internet and was

If Hasbro sued a website for having old Atari software available for
download, they would win the suit easily.

> You know it, I know it, they know it and I'm sure Hasbro of course
> knows it.
>
> This in fact defines what is free and public domain.

Once a work is copyrighted (under current law, that happens automatically
upon publication), it remains copyrighted until the copyright holder
EXPLICITLY declares the work to be in the public domain, at which point
he/she loses all protection and interest in the work.

> Copyrights intent are to enforce the right to profit on an item in that

Copyrights have NOTHING to do with money, profit, etc. The only time money comes into play is if a copyright has not been registered, the copyright holder can only sue for actual damages. If the copyright has been registered, the holder can sue for actual AND punitive damages.

> "you can have it but you must pay for it and buy it"

> LOSS!

They can still sue for punitive damages even if there was no financial loss.

> The Fact is Hasbro certainly hopes very much that people keep an
> active interest in these old titles

This is just your opinion and doesn't change the legality of distributing their copyrighted works.

> because it makes them more likely
> to buy their new Playstation or N64 versions of them. Of course
> nobody has the rights to make the new Playstation version of PACMAN
> HASBRO owns the copyrights to the name

Names can't be copyrighted. Names are trademarked (which they can lose if they don't enforce them). The copyright covers the actual game, the characters (trademarks can cover characters as well), and other creative expressions.

> and this was clearly their only
> concern and area which will be defended if infringed upon.
>
> Only a determined picker of nits would even waste bandwidth trying to
> explain or insist that these hundreds of web sites posting all the old
> 8 bit programs for years now are all about to be arrested or sued.

I never said that anyone would be sued. In fact, it is extremely unlikely that Hasbro or anyone else would take legal action against those who distribute 15 year old software. But that doesn't change the fact that they COULD sue, and would most certainly win.

> You know thats a ridiculous assertion so why make it?
>
> Thats quite nearly the most preposterous thing I have ever heard!

Whether you think it's preposterous or not does not change the law and the legal status of copyrighted works.

> End of thread I will not reply to it again. Thank you and I'm sorry
> for you and anyone who believes you - how awful to live in fear of
> retaliation for trivial things and having to live with yourself always

>Does anyone know if this modem will work with today's phones?

If I recall... it should work.. I think its 300 baud.... and, requires an 850 interface - although it should work with most other serial interfaces... a big hurdle is that it consists of 2 'cups' that you fit your handset into... so you'd need an old style telephone to properly fit....

I found a great site with tons of the old Antic Magazine type in programs.
I can load basic on the emulator (Atari800) but I can't figure out how to
load the basic programs! Any help will be greatly appreciated.

For the record, I have a CD recorder and most of my stuff that REALLY matters is going on CD. My cassettes are largely radio broadcasts, car mixes, crap like that.

And a pro cut-out cassette of reasonable length (King's X's _Dogman_ and _Faith Hope Love_ both clock in at 60+ min., and they're both ones I scored from the cutout bin) at 25 cents is a way better deal for nonessential recordings than, say a Maxell UD60, or even the Wal-Mart brand (Magnetics).

not hard. A new PAL processor board, A Main board crystal. If you want
to use a tv (rf cable), an Inductor on the main board needs to be
changed. Am not sure about the silver box on the power board..

> Yes it is true. It's extremely simple!

Yes, it is very simple - copyright is copyright!

Just because it's an old game which the company is no longer selling or making money out of in no way invalidates the copyright!

> Hasbro would not have the slimmest chance of winning a lawsuit
>or enforcing a copyright on some physical copy of Atari PacMan
>(C) 1983 for the Atari 800 because someone found it on the
>internet and was playing it on whatever say some PC 8bit emulator.

Before you start making such ridiculous assertions try actually learning something about copyright law.

> You know it, I know it, they know it and I'm sure Hasbro of course
>knows it.

Absolutely, we ALL know just how wrong YOU are....companies like Hasbro don't make an issue of such things because it's not going to make them any appreciable amount of money.

> In the case of these ancient programs it invalidates the Copyright
>because You CANT buy these old titles anymore....

Are you for real?

If you really believe that then you're living in a dream world!

> Only a determined picker of nits would even waste bandwidth trying
>to explain or insist that these hundreds of web sites posting all the
>old 8 bit programs for years now are all about to be arrested or sued.

So far that's the only thing you've actually gotten right, but that doesn't mean that these sites are not technically in breach of copyright.

> End of thread I will not reply to it again....

Good for you, you're finally realising you can't defend an undefendable position.

>....I'm sorry for you and anyone who believes you....

I'm sorry for anyone who believes your fantasies.

>....how awful to live in fear of retaliation for trivial things
>and having to live with yourself always sweating the small stuff
>so seriously.

I don't see anyone "living in fear", however it's better to be forewarned
than to simply bury your head in the sand.

> To never pick the flowers..

But they're not yours to pick....

TTFN - Pete.

DOUG> Copyrights have NOTHING to do with money, profit, etc. The only time money comes into play is if a copyright has not been registered, the copyright holder can only sue for actual damages. If the copyright has been registered, the holder can sue for actual AND punitive damages.
<End DOUG

I ABSOUTELY PROMISE to everyone in this group I will NOT reply again and I WILL give DOUG here the last word because he NEEDS it. First, lets take a moment to analyze his above statement. In one sentance he claims it (C) has nothing to do with MONEY and in the very next sentance he says they can sue for damages. What sort of damages Doug? Hmm. Monetary? Right which has EVERYTHING and EXCLUSIVELY just everything to do with MONEY!

Following the early days of the internet these historical software works were posted on many EDU servers such as UMICH for their educational value and preservation to keep them from being lost on floppies in peoples garages. Just because one law may state specifically that A must be so there are often other laws B C D which have overlap and conflict with law A and this is why we have courts to decide. Since I am unaware of EVER seeing or hearing about UMICH or ANYONE else ever being sued because they posted MULE on the web you really should feel free to stop sounding like a retentive retard anytime now.

END OF TOPIC.

I have the game Pitfall! for my Atari 800XL computer. I am having a very hard time jumping the scorpions. I used to play this game for the Atari 2600 many years ago. I don't remember jumping the scorpions being that difficult though. Perhaps it is more difficult on the 8 bit game. Not sure?

I consider myself a skilled video game player, yet I cannot master jumping the scorpions without dying every once in a while. Even when I think I'm making the perfect jump, I will still die sometimes. I seem to be having so much trouble that I cannot even run out time in my game because the scorpions always claim all my lives. Are there any tips or tricks someone might be able to give me so I can jump every scorpion every time without dying? Or am I just that bad?

471. OT: PB165 8/80 FS $120

Newsgroup: comp.sys.atari.8bit
Date: 2000-01-15 00:00:00 UTC
From: gp429@aol.com
Message-ID: <20000114235541.02807.00000540@ng-fs1.aol.com>
Source record: 47243

I have for sale a PowerBook 165 that has 8 megs of RAM (4 megs is built-in to the computer). I am selling it specifically to those who do not want spend a lot on a portable computer and also because it is an old laptop using a 68xxx era CPU, more specifically a 68030 running at 33 megahertz. The Mac OS is version 7.5.3 and I will include the setup diskettes (19 disks). This laptop is possible for light Internet use i.e. e-mailing and reading newsgroups but it is possible for web browsing.
This is the perfect portable computer to write that Great American Novel or writing your school papers because included in the 80 megs of hard-drive space is MS Works version 4.0. Write anywhere your mood takes you. You will be able to write on the train maybe on your way towards California where the wide open vistas of the West could inspire you to write a Western novel. Other uses of this perfectly running laptop computer is personal budgeting such as tracking your credit card usage with MS Excel version 5.0 which also included in the HD or use it for light business financial tacks. There is also the built-in 9600 data/14.4k fax modem from Global Village with ZTerm modem software. Possible uses of this built-in modem is exchanging e-mail with your writing agent now that you have sold that Western Romance novel <grin> to the highest bidder figuring out the royalty fees using, of course, the spreadsheet that is in the laptop or perhaps e-mailing your teacher to confirm what your next writing assignment is going to be about.
All the cables i.e. the telephone cord to plug into the phone jack is included along with the power supply for the laptop. There are other extras such as a microphone and an audio cable to hookup to an audio source and additional software is in the hard-drive. This laptop does not have any of the support manuals. This means you must be an experienced computer user or familiar with the Macintosh and its operating system. Price: $120. For more information or if you want to buy the PowerBook 165 e-mail me at gp429@aol.com

473. Word size on the 6502

Newsgroup: comp.sys.atari.8bit
Date: 2000-01-15 00:00:00 UTC
From: Peter Laing <NOSPAMsnailboy1@earthlink.net>
Message-ID: <A8Vf4.361$%Y3.25347@newsread2.prod.itd.earthlink.net>
Source record: 47245

Hi Everyone.

I originally said I considered it brain damaged to call a 'word' on the 6502 16 bits. Anybody who picks up a textbook
on computer architecture would come to the same conclusion. The 6502 has a word size of 8 bits. Sidney produced a good summary from the computer architecture point of view why.

Whats a 'word'

A word in the 6502 universe has nothing to do with word size. It's a 16 bit unsigned quantity. Two bytes/octets ;)
Thats the historical truth and nobody can change that. I knew that when I made my original post and I should have probably explained I was looking at the 6502 from an architecture standpoint.

So as for a summary:

6502 microprocessor

16 bit address bus
8 bit ALU
8 bit accumlator
2 8 bit index registers
256 entry hard wired stack
Word size 8 bits. Just like the 6800 and 8080

Size of a word when programming it: 16 bits, same as the size of an address.

eg STA $D20F ; $D20F is a 16 bit address or a word.

Does this make everyone happy ?

Peter

Old data sheets/books are fun things to read. I always get a great kick
when I read the 'advantages' of segmented design in the iAPX286 programming
docs. Motorola's 68000 book I had as a kid had the grooviest rainbow color
deal I have seen.

> I was flipping through a really old text on the 6800 micro, copyright
1975.
> In it Motorola defines micros by the width of the buss it uses for data.
> Never talked to a Motorola engineer, but I imagine they changed that
> definition when they came out with the 68008<or was it 68010? 680xx
anyway>
> with an 8 bit data buss.

68008 ;) I think it only had 20 bits of external addressing and 8 bits of
data.

68010 : From memory they fixed the non-restartable instruction problem.
This was the first 68K that you could do proper
restartable exception handling on. Before that the solution was to run two
68000's one clock cycle apart and if your leading 68K went into never never
land stop the trailing one in time.

I think using external bus size is the worst way of measuring the size of a
word on a processor. I once read a description of a MIPS R4xxx processor
that addressed (sic) this very issue. The author was comparing relative
RISC architectures and got stuck on the R4xxx. It had a 256 bit cache bus,
32 bit address bus, and was 64 bits internally. He ended up using something
like 128 or 192. Or 176 ???

>
> The micro manufacturers can't even get it right in their own shops so it
is

H Jan ,

i already did what you are trying to do...

Simply connect the 800 NTSC machine to a Multysystem TV, those tv can View PAL, Secam and NTSC sources. i have one of those 15" tv's that acts as my monitor. you can use the RF cable but most TV's also have VIDEO/AUDIO IN RCA connectors.

you will need to change the power supply to a 220v power supply or use a simple 220v to 110v transformer.

let me know if you have more questions..

IF i will find an PAL 800 computer here i will let you know

NIR

Are you sure of that Jon ? The changing of the speed and different sounds,
appears more like Douglas Crockfords Ballsong to me.

Well thanks to everyone for replying, I have been trying to locate 'Ballsong' on the net but cannot find it - it does appear to be the one I remember from so long ago (I think it bounced in a yellowish area). I tried Boink which although impressive is not what I was after.

If anyone has it on a PC disk, please can they send it me.

Thanks

Lux

In practice it seldom gets that far. Since a lot of the internet still runs
through .edu sites or places that have otherwise vested interest in
preserving the copyright laws, they will cut anyone off at the knees they
see violating copyright laws.

There are more examples, but I didn't and still don't think they relate
close enough to the current debate to have a lot of relevancy, but Origin
Systems Incorporated recently targetted two sites, Lum the Mad and Dr.
Twister IIRC over copyrighted material. In this case, it was because of
releasing confidential in house documents. Note that these in house
documents had no commercial value so that was not an issue. After the web
sites were roughed up by the OSI lawyers, they buckled.

Good point, we do have international copyright aggreements with most western
countries, but AFAIK the laws have not been extended to the former soviet
block yet.

Yes! It is one of those "makes me feel all warm and fuzzy inside" kind of stories. Desi and his family ended up becoming very well off relative to the other early tv stars because of it. I think he may have ended up buying the old RKO studios with the profits.

FWIW, the old Tonight shows that were saved are currently being shown on pay per view satelite broadcasts. Only about a buck a show I think, but they are still making someone money 20+ years later.

I don't recall that. I do remember Gary Gilberson making all of the songs and even unpublished ones available, but the only things I have ever seen from Philip himself were all along the lines of being in favor of copyright laws and AR copyrighted. Thing is, I am not sure about the copyright situation and what Price's deal was with Datasoft so I can't comment. I mean it could be Price assigned all the right to Datasoft or it could be they only had a limited term of distribution like a book publisher.

I believe Dan Pinal<sp> was the one of the programmers who did "The Dungeon" and came through the newsgroup, but I don't think he is the holder of all of the copyrights.

If you or anyone else has a copy of a Philip Price post or email saying "distribute away" I would really love to see it so this can be cleared up.

I don't really care if you get a copy off the net unless it really pisses the Copyright holder off, we just haven't figured out who that is yet. I got a copy of both City and Dungeon myself for SIO2PC use, but I have 1 real copy of City and 2 of Dungeon. My real drive often bombs out during copy protection checks with "Insert disk 1" ad nauseum so I prefer the cracked copies. This is particularily annoying when it checks for copy protection after stomping on you character during load and won't let you save w/o a check.

OK, I got a copy from American TV, but they are out of Atari now so point made for those titles. But for other titles, it still holds.

>
> Yeah, but all you have to do is demonstrate a reasonable effort to
> protect your copyrights over time. Then you are covered.
This is the trademark vs patents vs copyright thing.

For a patent, all you have to do is ~"show due effort". That is, if you patent a widget all the information and technology about the invention is published as a way of promoting information and technology exchange. Very old law, founding fathers kind of thing where they wanted to move us from a farming/rural country to science and technology.

The "due effort" is kind of a gray area. You don't have to make, sell, or file "Continuation in Part" subsequent patents on the invention, but you seem to have to keep fiddling with it on some level. I should know, but I haven't a clue just what "due effort" means. I think it means, "I was thinking about it" if they like you, but spending all your money and waking hours on it will not cut it if they don't.

Trade mark almost goes without saying, email a Xerox of the law while drinking a Coke to wash down some Aspirin kind of thing.

But copyrights have the lowest standard of all intellectual property. Let's say your wife/husband/mother/father died and left a diary that became a million seller. It was never their intent to have the material published, but I think there would be an implied copyright under the current law where you as the heir would be entitled to all the profits. Really low stand IMO.

You really don't want this tied to profits or effort because it leaves holes for abuse. For instance, let's say you franchise a series of 1,000 book stores. Each book store only sells 5 copies of someones copyrighted book xxx a year w/o paying royalties. Even have the books printed in China to circumvent the copyright laws for the printing. Now for the author, it should not be your responsibilty to sue 1,000 different stores for $5 each in order to stop them from violating copyright laws.

>remember a time when I did everything on my Atari.

Same here; now just mostly relive old times. Have a room full of Atari equipment, magazines, reference manuals and diskettes. It is a genuine "Personal" Computer because it is easily programmed by the user and much preferred over QBasic for generating applications that access any peripheral beyond the printer. Still use my ML cryptoquote solver and ocasionally enjoy Mr Do, JumpMan and LodeRunner.

Hell no I ain't sure. I know what all those demos are like but I
admit maybe I didn't interpret the original description correctly. In
addition to "Ball Song," didn't he also do "Hollywood Mideival?"

I do remember in Boink you could chage the spin and speed, so I
thought that's the one that was meant.

FamilyNet HQ: Telnet:\\209.217.2.202

> From: Greg Goodwin <lady-aramis@geocities.com>

Greg,

Per your request, have set up both Atari Newsgroups on the Dallas BBS, anyone in the Dallas area with an Atari could theoretically dial in (972-496-0650) and access these two newsgroups, as well as the two counterpart echoes in Fidonet.

If you are having problems connecting (I am still building this system from scratch) or have found another way of accessing, I understand. No problem, I will continue to port these newsgroups into the BBS.

All participants on this BBS also get an automatic free Internet E-Mail address to do Internet E-mail with (possibly a good benefit for Atari Users).

Also available as:

telnet://209.217.2.202
http://209.217.2.202
nntp://209.217.2.203

Have a good one...

Bob

Some emulators allow you to specify a hard drive subdirectory as one of the
8-bit drives (haven't used A800?) and I can LOAD"D2:file.BAS"
at the READY prompt or go to DOS and copy them to an ATR or XFD image for
loading from the READY prompt.

>> explain or insist that these hundreds of web sites posting all the old
>> 8 bit programs for years now are all about to be arrested or sued.
>> You know thats a ridiculous assertion so why make it?

Same thread different guy: Scary? Hey How wrong is this?

I actually went and read his 10 myths of Copyrights page because unlike DOUG I am open minded. The guy who wrote it is clearly biased in favor of defending Copyrights (and even says so himself on his 10 myths web page) Despite that he also clearly says that it is Civil law and that only current valuable works ever typically get defended in court for obvious reasons. His item #11 on his list of 10 Myths also supports much of what I said and keep in mind all of this comes from some web page essay from a guy who looks like a bowler who misplaced his razor and is clearly biased IN FAVOR of stopping (C) violations of any kind!

Here is another last pass at this since I have two guys going now :)

There are a dozen other perfectly viable defenses against being charged for having a web site with OLD 8 bit titles lets call this the

TEN REASONS WHY THE STUPID 10 MYTHS SITE DOESNT APPLY TO ATARI 8BIT CRAP WEB USENET PAGE (grin)

1) Financial loss for civil suit does not apply

So say We have Microsoft and someone posts maybe Office 2000 on their web site. Within a week they are shut down and Microsoft sues the owners for a million dollars. How does this work. Well Microsoft can claim they have damages for every copy downloaded which someone now did not have to go pay $200 at the store for, so you owe Microsoft THAT money and we are taking this to court.

2) 8bit crap is not a colectors stamp or 1st edition book

Old junk software does NOT go up in value because it is old or out of print. People dont buy MINT floppies and save them until the value goes up. So the least of these defenses is the fact that this stuff aint made or SOLD any longer anywhere, so proving financial loss would be way-past impossible.

3) Implausible civil case grounds and no basis in logic
4) If it's been on UMICH.EDU for ten years why bother now defense

Other defenses would certainly include why would anyone take on Billies House of Atari (fictional web site for illustration) and fault them for posting stuff they themselves probably downloaded from UMICH.EDU which had the same garbage posted there for ten years!?

5) It was all but lost if it were not for these brave electronic archivalists who preserved the art for us all to still enjoy and learn from defense

Another pretty good defense might be Historical preservation! yes! People going to school now might not know how even PIII-700's use the same 64k memory bank switching internally or why. Why Visual Basic is the way it is even has roots traced back to the Atari Microsoft Basic! Why are FAT tables made the way they are? Why was there a 2 Gig limit on FAT16? What were the old Atari Assemblers or the syntax of PILOT or ACTION languages and why were they invented? How did old FAT tables work on all those old DOS's and a million other questions all answered by familiarity with this old commercially worthless junk and almost impossible to answer without it!

6) We tried but COULDN'T ask for their permission so the world could no stand still and wait for them to answer us.
7) There are SO many authors and publishers who are out of business now it is impossible to KNOW who owns the rights to this stuff

It would be nearly impossible to track down one tenth of the old Authors to even ask permission and combined with their lack of any defense of their copyrights where people say on their sites (ask me to remove this and I will) for way over seven years now would clearly even surpass any statute of limitations on their right to step forward so many years later to try to resume the defense of their (C).

8) Educational need to know and learn and innovate and progress in the field REQUIRES knowledge of older software and hardware and the good of the many does sometimes exceed the greed of the few or the one!

We are doomed to repeat the same mistakes if we can't review what was done in the past and what worked well and what did not work so well. Historical educational value of this stuff SO VERY FAR exceeds its "gameplay" value (have you played any of those games they suck!) and just as a three hundred year old church is more important than some billionaires wish to build another parking garage in a downtown area EXACTLY SO is this old code.

9) Paranoia is EASY having gaul is NOT always so easy but we must dig down and find it in us to tell the Y2K type fear mongers where to get off (DOUG!)
10) THE LIBRARY defense used by all of the far more serious sites which traffic in more current software.

Many of these sites have now even gone paranoid because of guys like our buddy DOUG scaring them with a load of BS and they added the other defense of saying people must delete them within 24 hours unless the own them. Like as if anyone can FIND them in their attic anymore I

think my 8 bit floppies are still at the GOODWILL and after five years now they are probably trying to sell them as coasters. They then even have the "Library defense" to use if they wanted heck I'm no lawyer but I could even defend this case.

Ask me why I think you have never and WILL NEVER see Hasbro try to sue a web site for ole 8 bit trash and this becomes more clear. They have nothing to gain financially and would not wish to risk losing in court because then that skinny sliver of legal letter of the (C) law to which they cling might be lost plus the backlash would be far more costly to their image than anything they might even have a super slim chance of winning. THEN, have you ever won a lawsuit against anyone? Collecting is another issue unless Billies House of Atari web site is run by Bill Gates they wont ever see a dime and if it IS run by Gates they will fight in court for twelve years and maybe win damages of a dollar fifty!

11) Last but not least and JUST like the 10 Myths site NUMBER ELEVEN is the UP YOURS DOUG defense! I did it because I had to prove that annoying little turd WRONG!

Why do I waste the bandwidth? Because guys like DOUG annoy the crap out of me. They would work so hard to scare people just like the Y2K morons who did their best and it actually SLOWS our progress as a civilization when we heed their many fearful scary warnings.

It reduces INNOVATION because people sit around wondering if they can do things without getting in trouble or breaking some rule, rather than JUST DOING THEM and moving the world forward!

If it were up to these guys we'd all be sitting in a cave reading the scribbles on the WALLS wondering if it says we were permitted to GO OUTSIDE.

Nuf Said!

You do seem to have a severe problem with people disagreeing with you. I guess if it was up to the likes of you, we'd never have gotten to the stage where we'd be reading scribblings on the wall... We'd still be banging each other on the head with mammoth bones.

Your point may be a valid one; I guess we won't see until a company like Hasbro decides to take it's chances. You think it won't, and if it will, it would lose. So be it. You got your fifteen minutes, now would you _please_ cut it out. If you feel inclined to swear and curse your guts out at me, please do so - by sending me private e-mail.

Just a mild correction here... the 6502 was originally made by MOS
Technologies. Later, NEC, Rockwell, maybe others. Possibly even
Motorola I suppose.

It was called "Boink." Another version which had a Fuji symbol
instead of the ball was called, aptly enough, "Fuji Boink."

"Ball Song" was a different demo that played music while a ball
bounced around. That ball was smaller and faster, and the 'depth' of
the room was greater.

502. Cosmic Tunnels : 2 versions ?

Newsgroup: comp.sys.atari.8bit
Date: 2000-01-16 00:00:00 UTC
From: Denis Leroy <denis_leroy@vt4.net>
Message-ID: <38810D91.D1751536@vt4.net>
Source record: 47263

I have found several images of the game Cosmic Tunnels (DataSoft, 83) on various ftp sites (some ATRs, some file images) and run them with Atari800. They are all identical, and yet they are different from the version I have on floppy disk :
the ATR version does not have an intro music, just some lame sound effect, but the version I have on floppy has a really really great intro music.

Does anyone know about this ? Does anyone have an ATR of the version with music ? I'd like to rip a SAP file from it.

Cheers,
-denis

Hi!

Is it possible on a 800Xl (NTSC) to have an AZERTY keyboard instead of
the qwerty one ?
As far as i can remember it should be possible because when i was
younger i remember that i had stickers on my keys to hide the QWERTY
letters with the AZERTY set...

Thanks,

Marceau

511. Clock cycles missing!?

Newsgroup: comp.sys.atari.8bit
Date: 2000-01-16 00:00:00 UTC
From: Sidney Cadot <sidney@ch.twi.tudelft.nl>
Message-ID: <38819B53.301D051A@ch.twi.tudelft.nl>
Source record: 47272

Be forewarned! This is going to be technical up to and beyond the point of nerdiness... :-)

I set out to reverse-engineer the POKEY random generator of my PAL 800 XL last night. It's now 10am in the morning here, so things did not go as smootlhly as planned. I will outline the steps I took, and describe the problems I encountered. As of yet, I think I can predict the POKEY random value as read by peeking address 53770. But aye, there's the rub...! Rarely, but evidently, clock-cycles go missing.

To measure clock-cycle precise, it is important to do two things:

(a) --> disable interrupts; this can be accomplished by poking zero into NMIEN (54286), which disables
non-maskable interrupts, and executing a SEI, which disables maskable interrupts.
(n) --> disable ANTIC DMA: this can be accomplished by poking zero into DMACTL (54272).

The next thing to do is to get a contigious list of values as can be read from the RANDOM (53770) register. It is then hoped that staring at those numbers will gain some insight into the inner workings of the random generator.

Unfortunately, reading bytes from 53770 and writing the sampled bytes into a memory list takes time. For this reason,
I programmed a loop that would read one byte of random data, write it to a list, adjust the list pointer, and check whether the list capacity was reached. All this is achieved in 35 clockcycles per sample using the following loop:

```
SAMPLE LDA #$00
STA WRBYTE+1
LDA #$50
STA WRBYTE+2
LOOP LDA 53770
WRBYTE STA $5000 ; the absolute address here is modified...
LDA WRBYTE+1
CLC
ADC #1
STA WRBYTE+1
LDA WRBYTE+2
ADC #0
STA WRBYTE+2
CMP #$90
BNE LOOP
```

```
RTS
```

It is important to realise that something like

```
LOOP LDA RANDOM
STA (PTR),Y
INY
BNE LOOP
INC PTR+1
DEC PAGECNT
BNE LOOP
```

is not usable, since the number of cycles used is different for a sample when Y reaches zero. That would be very, very inconvenient.

The next thing to do is to get in sync with the POKEY. That's quite easy actually, one simply does something like

```
SYNC: LDA 53770
CMP #$VAL1
BNE SYNC
LDA 53770
CMP #$VAL2
BNE SYNC
...
... repeat a couple of times ...
...
LDA 53770
CMP #$VALn
BNE SYNC
RTS
```

One can find these values by putting a LDA 53770/STA NEWVAL before the RTS. After a certain point, all new values found will be the same for multiple runs; in that case, one has obtained synchronisation of the processor with the pokey. From that point onwards (let's call it "cycle zero"), reading POKEY a given number of clockcycles later relative to cycle zero yields the same value.

Now let's draw a picture of what we're going to measure

```
#0 #1 #2 #3 #33#34 #0 #1 #2 #33#34 #0 #1 #2
00 01 02 03 ...... 33 34 35 36 37 ...... 68 69 70 71 72 ......
```

below are the actual clock-counts, relative to cycle-zero. On top are the runs of the program. If we jump into to sample loop directly, we'll sample pokey values 0, 35, 70, 105 and so on. If we wait for one cycle before entering,
we get pokey values 1, 36, 71, 106 and so on.

So if we do 35 runs with different starting points, with each run sampling 16K points (cf. the sample loop given above), we get 573440 contigious POKEY random values, which will enable us to find (hopefully)

the pattern we're after.

A side note about the issue of waiting N cycles before entering the loop: This is not quite trivial, since no 6502 instruction takes just 1 cycle. I used a subroutine like this:

```
WAIT: SEC
SBC #37
LSR
BCS .1
.1 LSR
BCS .2
.2 BCS .3
.3 LSR
.4 BCS .5
.5 BCS .6
.6 BCS .7
.7 BCS .8
.8 SEC
LOOP JMP .9
.9 SBC #1
BNE LOOP
RTS
```

...which enables me to insert code like

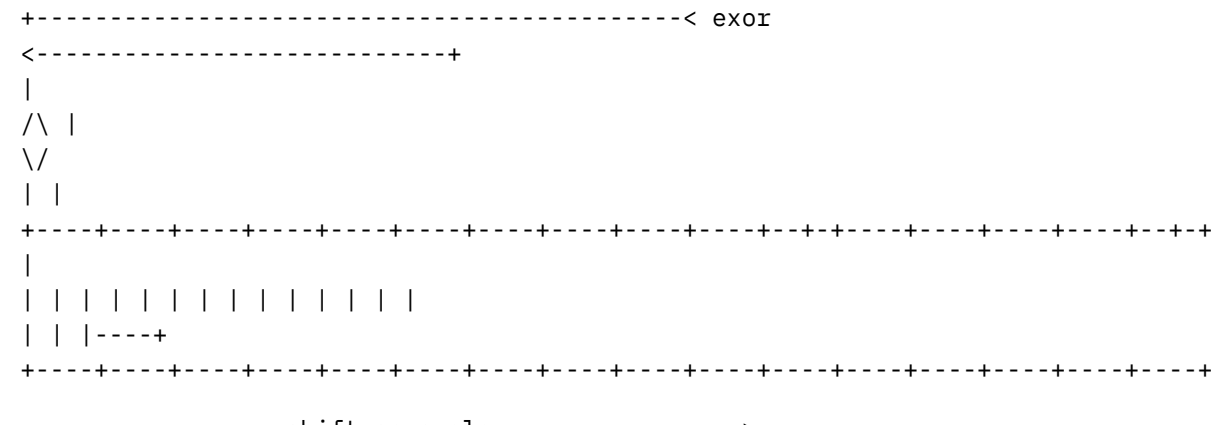
```
LDA #100
JSR WAIT
```

and these two lines now take exactly 100 CPU cycles to execute. The WAIT subroutine is quite interesting; it uses the fact that "taken" branches take 3 cycles while "non-taken" branches execute in two to strip off the lower 3 bits of cycles-to-wait; it then loops around an 8-cycle loop for the rest (the JMP .9 serves to get the loop cycle count to eight: a power of two). I would be curious about smarter solutions to this problem of cycle-accurate waiting; does anybody have a clue?

Ok, that's all the machinery I needed. So now I did 35 runs, 35 bsaves, and 35 transfers to my PC to get the data. On the PC, the data can be simply unpacked using a small program. Lo and behold: a 573440 byte file of cycle-accurate POKEY-produced random numbers are there.

"Mapping the Atari" mentions that the POKEY uses "17-bit polynomial counters". I happen to have done a course about those devices; they are also known as "linear feedback shift registers". The basic trick is this:

The POKEY holds a 16-bit register. On each cycle, it shifts all 16 bits to the right; one falls out, and a new bit is shifted in. This bit is calculated as the exclusive or of the bit that is falling out ("bit 0") and the bit at position #5, before the shift:



All this can be deduced from the data in the 573440-byte file. It takes
a little twiddling with bits and some math, but once you recognise the
shifting bit-patterns in the data-file (it's easy to see in hexadecimal
numbers!), and
know the "Mapping the Atari" story about it basically being a circuit as
shown above, figuring out which bits get XOR'red is basically the only
thing left to do.

(One note: Mapping the Atari talks about a 17-bit polynomial counter;
the register is really only 16 bits wide. That's because there's some
math underlying all this that can associate circuits like these with a
so called "polynomial",
which is always of 'degree' #bits + 1. A bit confusing...)

If only life were that easy...! It seems to be that there is a problem
with clockcycles getting lost.

My Atari is a PAL version. In every horizontal scan line, it does 105
processor cycles. It does 240 scan-lines per display period, plus 72x(1
scan-line-time) for the vertical blank, when the electron beam sweeps
back during vblank.

Now when you look at the datafile (as I did...) It is noticeable that
there is a pattern where the POKEY random values deviate from what one
would predict using the shift register.

Every 105 cycles, there is a group of 9 random values, 3 values apart,
where the shift register seems to SKIP one value: a value that was
expected is not read.

This is my first problem. I suspect this has got something to do with
keeping the PAL version somehow "similar" from a (software? hardware?)
perspective to the NTSC version. If, during every vblank, there are 9
consecutive periods of four cycles, the first of which is *kept away*
from the processor (i.e., the processor would be stalled during such a
cycle!), this would explain the pattern perfectly. But *WHY* does this
happen!?

Then the second thing, which is most unnerving. Very rarely, with no
discernable pattern, a "stall-cycle" doesn't happen! The pattern,

however, continues normally afterwards. Now *that is odd*!

I reran the full 35-step process to check my measurements. The Atari had been of and on in between. I managed to reproduce the EXACT SAME result, except for *****ONE***** sample out of 573440!!!

Now how can this possibly happen? One theory would be that the circuits for generating the stall-cycles sometimes "miss a beat". But frankly, I am completely flabbergasted by this.

So there... Does anybody know anything about these 9 eerly cycles? Or perhaps even about some of them going astray? It would certainly make last night more worthwile to me. I would also like it a lot if somebody could perform the same kind of timing experiments on an NTSC Atari. It surely takes some effort, but its actually quite nice to try to pin down every last cycle of the Atari...

Regards, Sidney

PS. a very net trick for getting up to speed with timing the atari is disabling interrupts and DMA, then doing a loop like

```
LOOP
LDA #14
STA 53274
LDA #0
STA 53274
LDA #90
JSR WAIT
JMP LOOP
```

This will show a vertical white bar on the screen, a sort of CPU-maintained Player Missile Graphic. Especially if you don't disable IRQ's it's pretty cool, you can then use the keyboard (which burns a few dozen cycles per keypress) to move the bar horizontally. And *darn*, those nasty 9 missing cycles are visible then! On certain horizontal positions, the white bar is wider: -- you can actually see the 6502 stalling between the two STA 53274's !! :-))

I always wondered this myself. Maybe it's Glenn Saunders? :) I first started reading this group in 1995, and awhile after, while hunting through a bin full of Atari floppies, I found a game programmed by Jim Nitchals. That was pretty cool.

I don't think so, mainly because Saunders never mentioned anything about it
in the newsgroup and the topic had come up when he was participating.

At one time someone posted that they knew Glen the 5200 man and foggy memory
but I think they described his set up as ~"A hacked Atari 8 bit with wires
going everywhere". Not sure about what model he used, but for some reason
130XE comes to mind. I can't remember where the poster was from, maybe
Pacific North West.

I didn't read whole post, bcoz Your post is tooooooo long ;)
I can only tell You how exactly that "cycling thing" looks:

In PAL, one screen has 312 lines. Each line is 114 CPU cycles long.
ANTIC ALWAYS(!!!) steals 9 cycles: 25,29,33,37,41,45,49,53,57.

Oh, another thing, might have been mentioned, but you need DOS loaded first.
Try getting an ATR with DOS and boot that as drive 1, then the basic
programs in drive 2

THEN hopefully you can
LOAD "D2:FILENAME.BAS"
and RUN it

Good luck again :-/

It might have been Ballsong or Boink, but there was another one called Ping, where you used the joystick to move a dot around the walls of a cube. When the ball touched this dot it would bounce faster, and if it didn't hit the dot it would gradually slow down and stop. It was sort of a 3-dimensional, one-player Pong. To find this, I fired up my 8-bit for the first time in months; the hard disk had lots of bad sectors! Maybe I'll finally get around to building that SIO2PC cable...

526. Xformer Cable

Newsgroup: comp.sys.atari.8bit
Date: 2000-01-16 00:00:00 UTC
From: Carolyn Hoglin <choglin@usa.net>
Message-ID: <388299DD.84F7A199@usa.net>
Source record: 47287

My husband and I have made this cable according to instructions found at www.emulators.com, and checked carefully each pin/socket for opens and shorts. It tests out perfectly, but it will not allow me to access my Atari XF551 using any of the Xformer programs. In case the fault lay with the drive, I borrowed a friend's 1050 drive, but it won't work either. Does anyone have an idea of where we may have gone wrong? (We are following the pinout for the I/O port from a 130XE manual - reversed for the plug, of course.)

527. Re: WTB: 1050 Disk Drive

The APE solution requires an actual 8bit Atari. What Carolyn is trying
to do is plug a 1050 into her PC, to read old Atari floppy diskettes
she found in a closet.

I'm sure there is another easier solution. The AZERTY stickers i had where
provided by Atari here in France !
It should be a jumper or a poke to do it...

Regards,
Marceau

Here in France. But it was not an AZERTY keyboard. It was a QWERTY keyboard
but mapped as an
AZERTY with plastic AZERTY stickers pasted on the keyboard.

Any idea of a poke or jumper to change ?
Thanks and regards,
Marceau

It's fairly easy: you copy the keytable to RAM, then modify it
accordingly, then poke the new address into the vector...
You see, tne vector is called KEYDEF and lies at addresses 121/122
(LSB/MSB). It normally points to location 64337.
The table itself is 192 bytes long: the first 32 for the keys,
the next 32 for the SHIFTed keys and the next 32 for the CTRL'ed
keys. Now, I don't remember if the table gives ATASCII values
for the characters to be generated by the keypress, or the
internal character set values... In any case, the order in which
the table is sorted is the one of the values returned by the
internal keycodes which you can read by peeking location 764.
Note: this works only in XL and XE models (including the 1200XL),
not on the older 400 and 800.

The old Antic steeling cycles for memory refresh trick. It cannot be
stopped.
Don't forget that there 2 versions of Antic for each tv standard.
The difference is in the refresh rate. Something along the lines of a
9 bit refresh for the latter antic. The earlier one has 8?bit recycle?

Your programme would get a different result on a 400/800 as to an XE.
Am not sure about XL's. I think early ones have the old antic, newer
ones have new antic.
I seam to recall, if a branch instruction branches across a 256 byte
boundry, Add one cycle

Was just woundering how random the antic random number generator is.
ie, If I wrote a program that read the random number, read a second
and looped that number of times, stored that in a table and used that
to encript something with a simple EOR, Would any body be able to
crack it? Of course, all interupts would be enabled.

I ran my program on an 800 XL... Unfortunately, I do not have access to
a 400 or 800.

> I seam to recall, if a branch instruction branches across a 256 byte
> boundry, Add one cycle

That's true, but that's not an issue in my program.

> Was just woundering how random the antic random number generator is.

This is C code generating the clockcycle-wise PEEK(53770) value as
produced by the ANTIC:

```
unsigned short STATE=0xffff;
while(1)
{
printf("%d",STATE&255);
STATE = (STATE >> 1) ^ ((STATE&0x8000) ? 32768 : 0) ^ ((STATE&0x0200)
? 32768 : 0);
}
```

As stated before, the processor doesn't get all these values: 9 out of
every 114 go missing due to ANTIC memory refresh cycles, and then there
are the spurious missing cycles I think I'm detecting.

Nevertheless, it's definitely not random. In a cryptology course I heard
that the military used stuff like this for codes up to a decade or so
ago, but they stopped doing that for security reasons.

Although in practise it wouldn't be easy to crack a code based on this,
it isn't unfeasable, especially if a binary of your encryption software
is available. Enabling the interrupts could make things a lot harder,
but a security system that depends on that type of protection is
inherently flawed.

One of the largest problems is the small number of "state bits" in the
counter. It only has 65535 states (the all-zero state is not used). The
114-cycle pattern really only adds just under 7 bits to this. It is
embarassingly easy to enumerate all these states (interrupt hassles
aside - but that can be overcome). Furthermore, if your loop cycle count
happens to be divisible by three, the additional complexity as gained by
the 9 refresh cycles is a lot less. In short, it's a mess.

> ie, If I wrote a program that read the random number, read a second
> and looped that number of times, stored that in a table and used that
> to encript something with a simple EOR, Would any body be able to
> crack it? Of course, all interupts would be enabled.

I think even I could, so I wouldn't recommend using it for issues of national security. The NSA would have a field day with this :-)

You could put me to the test on this... Just encrypt a file of, let's say 5Kb, containing only the characters A-Za-z0-9.,;:!? and spaces, with a further restriction of it being written in English, using the method you describe. If you provide me with the encrypted version as well as the code you use (in a real crypto environment, this would be assumed to be available to the enemy) I will have a go at cracking it. I'd appreciate having a source version of the code as well, which would be obtainable by reverse engineering the binary anyway.

You may say that the conditions I put on your encrypted file are rather strict; however, if an algorithm isn't capable of handling that kind of input safely, I think you would agree it isn't very good as an encryption algorithm.

Best regards,

Sidney

I know that Necromancer runs under the DOS version of Xformer but I am not aware of the other program since I have never heard of it. Xformer is now available for free so you can download it at http://www.emulators.com and click on the Atari 8-bit picture. I haven't tried it under the Windows version of Xformer so I don't know if it will work there. However since the Windows version of Xformer is now free as well, you could of course just download it and try it as well.

> mine. Do you have any hints for using this cable?
Xformer cable relies on precise timing which I assume you can't get on a PC
because of the Windows multitasking. You could try to reboot in DOS mode.

There are several alternatives, anadisk if you have a PC with a 5.25" drive
and DEANA by Preston Crow IIRC will make an image.

In this case, the Prosystem cable the poster talks about lets you move both
normal and copy protected software to a IBM PC w/o an Atari computer being
needed. It is not a Xformer cable, that is a different beast.

The most popular solution seems to be a real 1050 and a real Atari 8 bit
with one of the variations of SIO2PC cables. Both SIO2PC and APE are rock
solid and turn your PC into a fast Atari drive.

There is a guy from Europe that sells SIO2PC cables on eBay for ~$25 or if
you can solder you could probably make one for <$5.

Same experience; Darek Mihocka (the author at darekm@emulators.com) was kind enough to answer my e-mail and explain that this 4 year old technology has timing problems accessing the 8-bit floppys on the current processors running faster than 75-100 MHz. The emulator is just going too fast to catch the handshakes from the drive. I am hoping the new XFormer2000 remedies this but haven't tried yet.

I have already tried using the PC Xformer in DOS mode, but it still didn't work. The screen would say, "Calibrating cable," for quite some time, and then finally say, "Unable to calibrate cable." I can't use the anadisk because I don't have a 5.25" PC drive, and I can't go the SIO2PC route because I no longer have my Atari 130XE. I gave away my entire collection of hardware and software just before I heard about the Atari 8-bit emulators. Then I came across a spare XF551 and around 30 disks that had been deep in a closet. I've had real good experiences with the Xformer program, and the Xformer cable as described would seem to be exactly what I need. I fully expected it to work.. Since other folks are making it work, why can't I? I have a brand new 500mhz computer, so the "precise timing" you refer to should be available to me if others have success with their machines, don't you think?

I do appreciate your taking the time to answer me, and if you think of anything else, please let me know.

Thanks.
Carolyn

The problem with the XFormer cable is that the program is trying
to do serial i/o on a parallel port, one bit at a time. Build yourself
an SIO2PC/APE interface, or even better an ProSystem interface, both
of which attach to a serial port.

553. Gene Ehrich ripped me off

Newsgroup: comp.sys.atari.8bit
Date: 2000-01-17 00:00:00 UTC
From: Mathematatin@webtv.net
Message-ID: <24083-3883B36E-36@storefull-134.iap.bryant.webtv.net>
Source record: 47215

Gene Ehrich posted a notice on this discussion group awhile ago saying he had Atari stuff for sale at his web site. I went to his web site, found a DOS 3 disk I wanted to order and contacted him. He replied back with:

I have put it aside for you.

Please send payment which includes shipping to address below: Please make payable to Gene Ehrich.

A pre-addressed mailing label would be greatly appreciated if possible.

Payment Amount: $7

Send To: Gene Ehrich
P.O. Box 209
Marlton NJ
08053-0209

Thanx for your order.

Gene

http://www.voicenet.com/~generic

Gene Ehrich

gene@ehrich.com
generic3@home.com

It has now been a month since I mailed my payment (money order). I have tried contacting him numerous times about it, and he has never replied. I just wanted everyone to know so others don't get ripped off.

By the way, does anyone have an extra Atari DOS 3 Master Diskette he can sell?

554. Re: What are you using your Atari for?

A very valid question, both to the roleo fo Linux and the 8-bit and what I do with my Atari8. Let me see if I can answer both.

Right now I have a fun setup going, and it is only going to get better in my opinion. I have an Atari 400 that has been upgraded to 48K with a 1400 XL keyboard on it, commonly referred to as the "Franken400". Got a laplink cable going between the 850 interface, the 14.4K modem and the ST. The ST translates the information coming through the BBS's in nice 80 column mode while all input is from the Atari 400. Soon I hope to get the SIO2PC cable to use the ST's hard drive. However, thanks to a A/B switch (the Atari8 and ST "module" share the same monitor) I can switch over for ST applications. Through the ST (controlled with a trackball) I control the CD rom player. With the Atari8 I have, of course, the ability to play cassettes. :)
Currently using a RGB monitor tuned through a broken VCR. The Atari8 and ST-Module are connected with a A/B switch to the RF port on the VCR and tuned to channel 3. Through the VCR my Atari8 setup can tune in the local TV channels when I'm not using it as a monitor for the computer.

Heheh.. I love my hodge-podge "multi-media" computer setup. :)

I've only been working with the Franken400 here in recent times (recently brought of retired) only since about December. However, I use...

Bobterm (Great use of dialups and macros (even using a joystick)
80 Column Reader
Atari Writer (nice, quick (cartridge) and simple)
A.M.S. Music player

Currently play (on cartridge) Star Raiders, Archon, Joust

Reading up on the Assembly Language about 7 pages a day. :)
(And sometimes give Basic a try)

That's it at the moment. BBS'ing, games, word processing.

On the "ST-Module" (1040 STE, 4 megs) I use:

Freeze dried term (to interpret the gibberish going on between the
BBS and the Atari8)
ExtenDOS (for the CD-Player)
{Considering using 800XLDJ so the Atari8 can use the ST-Mod's
harddrive.}

One thing I would like to do, speaking of Linux, is find the way to
make my Linux box that I am tinkering with into a server box for my
Atari8. (Hey, for a computer to work into my home life it has to
connect SOMEHOW with my Franken400). Linux is cool in the respect that
it does have a server logon just like some unix servers I have seen. I
am wondering if there is any way to connect an Atari8 through the serial
port, and log into the Linux box. This is something I am looking into.
The idea here is, since I can't find any shell accounts (or BBS's
with internet access) I am thinking of getting my Linux box to connect
to the internet and down load the mail I have, and then I can connect to
the Linux box with the Atari8 and read the mail through the screen of
the Atari8.
Write messages while still on the serial connection, and have the
Linux box send the new messages when I'm done.

Have it do that for E-mail and newsgroup messages. I know it's
possible, I just need to figure out how. :)

Take care folks,

Doctor Clu

PS: Of course with a Linux box you could just set up the Ape-interface
software and do all that stuff I just mentioned online :)

Now

555. Re: Xformer Cable

Thanks for your response. Of course, it wasn't what I wanted to hear. (At least Darek Mihocka answered you. I wrote to him, also, but never received a reply.) I thought my chances for success would be better now that Santa brought me a brand new, faster, computer. From what you say, I'm in worse shape than before (as regards my ability to use the Xformer cable with the Xformer program). I have tried to get it to work with PC Xformer, Xformer 98, and Xformer 2000. I tried the DOS version in the Win98 DOS window, as well as restarting in DOS. Doesn't work no matter what.

Why would anyone want Atari DOS 3? It was simply awful and was soon replaced by Atari DOS 2.5. (I know, I know. You'd think the higher number was newer and better. Not so!) Everyone happily reformatted their old ver. 3 disks.

No, I don't think that DOS 3.0 is better. I recently aquired a brand new Atari 1050 disk drive in the box. Well, I guess not brand spankin' new: the drive was never used, but the box was opened and it was missing the DOS 3 Disk. I just want the disk for my collection.

Adam Bienias wrote:

> In PAL, one screen has 312 lines. Each line is 114 CPU cycles long.
> ANTIC ALWAYS(!!!) steals 9 cycles: 25,29,33,37,41,45,49,53,57.

Ok, I got out the 'ole 400/800 hardware manual, which states the
following:

"The ANTIC chip steals cycles from the 6502 in order to do memory
refresh and fetch graphics data when needed. [...] Memory refresh takes
9 cycles out of every line, unless pre-empted by a high resolution
graphics mode."

That's nice, it explains (most of the) skips in the RANDOM reads. Still,
I'm having difficulty understanding a few things... Maybe someone can
help out:

* Why do the refresh cycles occur 4 cycles apart? Why are there 9 of
them?
One possible explanation could be that the first eight are directed at
each of the 8 chips ("prepare for refresh"), and the ninth is an
"engage refresh" signal. But that's a wild stab in the dark; I know very
little about
hardware at this level of detail.

* when Adam says cycles 25,29,33,37,41,45,49,53,57 get stolen, what are
these numbers relative to?
start-of-horizontal-blank? end-of-horizontal-blank?

* What about those offbeat refresh cycles / refresh cycle misses I am
detecting? I will perform some measurements,
perhaps next weekend, to try to get some more insight into this. I
hope I don't need an oscilloscope, because
I don't have one :-)

* Is the number of scanlines (PAL: 312, NTSC: 262), together with
hardware modifications to make the colors appear
similar, the only difference between PAL and NTSC systems? The XL and
XE's have code in the ROM to detect
whether they are driving a PAL or NTSC machine; were there different
ROMs for PAL and NTSC machines in the
400/800? Were any SECAM Ataris produced?

Best regards,
Sidney

It's fairly easy: you copy the keytable to RAM, then modify it
accordingly, then poke the new address into the vector...
You see, tne vector is called KEYDEF and lies at addresses 121/122
(LSB/MSB). It normally points to location 64337.
The table itself is 192 bytes long: the first 32 for the keys,
the next 32 for the SHIFTed keys and the next 32 for the CTRL'ed
keys. Now, I don't remember if the table gives ATASCII values
for the characters to be generated by the keypress, or the
internal character set values... In any case, the order in which
the table is sorted is the one of the values returned by the
internal keycodes which you can read by peeking location 764.
Note: this works only in XL and XE models (including the 1200XL),
not on the older 400 and 800.

There are two different cables, they just look a lot alike but aren't
interchangable.

I am biased on the topic, but Steve is right, the Prosystem cable is the way
to go under the circumstances. He has plans posted on his web site for
people that want to build it themselves.

The Prosystem cable the same job as a Xformer cable i.e. you hook the cable
up to a serial port of your IBM and attach a 1050 to the other end, no 8 bit
computer is needed to transfer disks. The main difference is the Pro cable
uses the serial port so it should be compatible with any PC hardware vs the
Xformer cable that uses the printer port and relies on software timing.

He was half right. The Pro Sys cable will allow the Atari drive to
hook directly to the PC. The APE cable lets the PC behave as a fancy
peripheral box for a real Atari computer.

I think they were manufactured by QMS<?> and also made for other platforms.
I can't recall the exact model of QMS, but you should be able to find
drivers and support for them.

This cannot be done. The SLM printers don't connect to the parallel port,
but to Atari's proprietary ACSI port. They are designed to work with an
Atari only, since they use the ST's RAM. This was Atari's way of providing a
cheap laser printing solution.

There is a software solution that allows you to print to an SLM by using an
Atari ST as an interface. The ST must have at least 2Mb of RAM to run an SLM
printer.

In any case, it is probably not worth it. You'll be very lucky to find
cartridges for this printer, and the quality is not up to that of a modern
deskjet type printer.

569. Newby disk (1050) question

Newsgroup: comp.sys.atari.8bit
Date: 2000-01-18 00:00:00 UTC
From: Ron Slaminko <ronald.slaminko@boeing.com>
Message-ID: <3884DB09.2D26774D@boeing.com>
Source record: 47153

I finally found what appears to be a working disk drive to add to my growing collection of Atari 8-bitters. If I turn the computer (800XL) on with the drive attached and powered up, I get a "Boot error" message - not surprising since there's no disk in the drive. I believe I need an operating system disk to boot up, but of course didn't get one with the drive. So I've got a 3-part question.
#1 - Where can I get a replacement disk? And, if the easy answer is that it's available online, then
#2 - What tools do I need to transfer this disk image into 1050 format using a PC with a 5.25" drive? I'd rather not mess with making a custom cable to hook the 1050 to the PC unless that's the only option.
#3 - What's the recommended s/w for making backup disks (using only 1 drive) and where might I find that?

Thanks in advance for your replies!

I remember the 1090 being the serial ports, parallel ports "thing"?

And, then bought all the parts and assembled it. It worked. I now
forget if it needed a rom burned - seemed so, but it was a long
time ago. I think I actually have a blank boardi, schematics, and
instructions; unfortunately, I just moved and EVERYTHING is in storage
for an undetermined time.

Sorry for no help, but thanks for the blast from the past.

Can someone supply me with a diagram, and pictures, of how to build a cable to hook my 130xe to a monitor? My monitor has a RCA video in and a pair of RCA audio in.
Thank you!
Steve.

I do believe that a guy, I think his name Jason Worley who posts on this
site, builds and sells the pc2sio cables to hook the PC to the 8 bit. I
bought one off him, and Steven Tucker sells the software to do it.
Good luck!

Just a matter of a lot of work. The 5200 is a 400 with the insides
scrambled around to prevent the code from running without conversion.
Memory map is different, controller keypads replace the keyboard, analog
joysticks done using the paddle inputs instead of 8-way joysticks.

I suspect Glenn was an Atari insider, who heisted source code and changed
the .DEF files. The 5200 hardware is identical to an 8-bit; the custom ICs
are just mapped into memory differently. All it would take would be
swapping a set of 800xl maps for labels and writing a controller handler.
With access to original source code, perhaps a one or two day effort.

David P.

> you wanted, Heck, they stop it anyway to do their thing.
Any read or write to the any of the existing hardware chips, which happens a
lot, would have to be done at 1.79 mHz.

The phase 0 and phase 1 clocks will come into play so the timing has to be
perfect.

There are other problems, like there aren't a lot of 3.6 mHz 6502Cs forsale.
We don't even have someone around that can consistantly make a living
selling daughter boards that let you use any 6502. Everyone that has tried
it in the past kind of got a rude awakening to the market.
>
> All I'm saying is if it were possible, and you ran the 6502 off a multiple
> of the 1.79MHz clock, but still ran the video system off the same 1.79MHz
> clock, wouldn't the 6502 just run say 3-4 times longer before being
> interrupted by the video system?
Welp, pull out pin 37 of your 6502C, attach it to the output of a 2 mHz
crystal oscilator. Attach the +5V and Ground pins of the oscilator to pins 8
and 1 of the 6502C respectively. GTIA<which kind of generates the system
clock in a stock system normally but not the phase clock> will still be
running with the existing 1.79 mHz signal.

3 connections to test it for first phase, maybe a fin for the oscillator.

Let us know how it works out. I pulled out my old soldering iron a few
months ago for a project and found out it is kaput. I haven't bothered to
get a replacement yet.

I've got a feeling it is going to end up being a lot more complicated then
that, but what the hey.

Bootable disk images are availble with Xformer emulator. It can be found at
the archive at umich or several other spots. SIO2PC and APE both have
bootable images distributed with them too.
> #2 - What tools do I need to transfer this disk image into 1050 format
> using a PC with a 5.25" drive? I'd rather not mess with making a custom
> cable to hook the 1050 to the PC unless that's the only option.
It is a good option though because of your next question.

The real problem is your 1050 only supports 128 byte sectors and the only
people that seem to be able to consistantly read/write that format is
ANADISK. To compound this problem, Atari drives have their data in inverted
format which requires a utility to get it straightened out.
> #3 - What's the recommended s/w for making backup disks (using only 1
> drive) and where might I find that?
Normal DOS will duplicate a disk, you just have to swap the disks in and
out.

But if you do make a SIO2PC cable, the PC simulates another Atari drive so
you can just copy from your real 1050 to the PC simulating D2:

I had a funny experience. My 1st 1050 came with DOS 3 and when I turned it on, I got a BOOT ERROR. Knowing nothing about the machine and thinking something was wrong with the drive, I returned it for another. When I turned this one on, I got another BOOT ERROR. Frustrated, I went to a local computer store and met one of the employees who eventually became my closest Atari compadre... He gave me a copy of DOS 2.6f and away I went. Those two bad DOS 3 disks probably saved me having a lot of compatibility headaches down the road. I probably still have one of those bad disks here somewhere.

Richard,

But will the Prosystem work with the Xformer emulator? I'm concerned that the program may be written to only look at the parallel port for a floppy drive. I don't want to go to all that work for another cable that won't do the job. Another question: I checked out the plan for the Prosystem interface. Why do the instructions say to connect to a DB25 and then use a DB25/DB9 adapter? Why not just wire to a DB9 to start with?

Hmmm ... this will be hard work! The SLM804 (a page-printer) is designed to use the ST RAM to prepare the page image prior to printing. So, you not only need to emulate the printer interface but also the DMA (store-access) interface. Good luck!

Roger

> these numbers relative to?
> start-of-horizontal-blank? end-of-horizontal-blank?

When I was calculating those numbers, I was assuming that, cycle 0
is a cycle when ANTIC reads first byte in Display List. I was assuming
that this is a cycle number 0, because I was using sprite positions as
a base. Cycles 1 and 2 are used for reading address, when program counter
is readed (DL code 0x01, or 0x41) or when data counter is readen (when code
is a graphics mode number and bit 6 is set). For other cycles see description
bellow.

0 - read Display List code
1 - read counter LSB
2 - read counter MSB
3 - read missiles
4 - read player 0
5 - read player 1
6 - read player 2
7 - read player 3
8 - generate DLI if DL code has only one screen line
9 - free
10 - free
11 - free
12 - begin reading data (if needed)
.....

For graphics modes, ANTIC begins reading data, 4 CPU cycles before line will
be shown. Each display data byte is readen every second cycle.
Additionally in text modes in first line, ANTIC reads character
numbers. Each character number is readed one cycle before displayed data will
be readen. Also, when line has enabled horizontal scrolling, ANTIC delays reading
data, depending on scroll value in $D404. When horizontal scrolling is enabled,
ANTIC starts reading data, 6 cycles earlier. For example: BASIC's Graphics 15,
Normal screen. First byte will be readen in cycle 20. When horizontal scrolling
is enabled, first byte will be readen in cycle 14 but only when $D404 is 0 !!!.
If $D404 is 4, ANTIC starts reading data with one "reading cycle" delay (one
"reading cycle" takes two CPU cycles). Value in $D404 is divided into 2 parts.
Bits 0 and 1, delays displaying pixels in current data byte. Bits 2 and 3, delays
reading data from memory (0-no delay, 1-delay 1 "reading cycle", 2-delay 2 "reading
cycles", 3-delay 3 "reading cycles"). So cycle stealing depends also on current
horizontal scrolling (if enabled).

Hi,
I have the following items for sale:
-2 Macinotsh Pluses - one of them has a non working floppy drive, other than that it is in perfect condition and the other one has a bad picture tube (you have to let it warm up for 5 - 10 mins before it will come on), other than that, the second one also works perfectly. Both come with the original Mac Plus keyboard and mouse and the first one to get sold comes with a power cord (sorry I don't have 2) and some copies of system disks for the Plus. Any more questions, just e-mail me. You can see a pic of one of the Pluses (they both are actually very similar in condition) at:
http://members.aol.com/kjj58/MacPlus1.jpeg
I am asking $25 each for these plus shipping.
-Epson MX80FT Dot Matrix Printer - I have no clue if this printer works or not, I think it is for non-Apple computers anyway. It has not been tested whatsoever, so I can't guarantee anything. E-mail me if you have more questions. You can see pictures of it at:
http://members.aol.com/kjj58/EpsonMX80FT1.jpeg
http://members.aol.com/kjj58/EpsonMX80FT2.jpeg
http://members.aol.com/kjj58/EpsonMX80FT3.jpeg
I am asking $10 plus shipping.
-Atari 1020 Color Plotter Printer - this unit is also totally untested and it is for use with Atari's 8 bit computer series. This is for the printer only, no power adaptor, sorry. If you have any questions, e-mail me. You can see pictures of it at:
http://members.aol.com/kjj58/Atari10201.jpeg
http://members.aol.com/kjj58/Atari10202.jpeg
I am asking $5 plus shipping.
Thanks so much! I am flexible with the prices though if it comes down to a few dollars here or there.
-Matt

> I am wondering if there is any way to connect an Atari8 through the serial
> port, and log into the Linux box.

This should be straightforward once you have the SIO2PC cable and some experience with linux system maintenance. The linux manual pages you'd want to consult are those of "inittab" and "setserial".

I did some twiddling with serial comms between the Atari and from the linux point of view, it works just like any other serial device (I modified Preston Crows driver which enables the Linux box to be used as one or several diskdrives for the atari).

I don't know about the atari side though. The Atari serial driver really expects command frames and data frames, and a direct serial link works on a lower level. It should be relatively straightforward to implement nevertheless...

I have no experience using BobTerm, I would guess it works through the R: device (850 -- which I have also never seen). But maybe it has a "drive serial bus directly" mode, in which case it should work out of the box.

Best regards,

Sidney

It's always advisable to get a phone number when purchasing from
strangers. Regarding the DOS 3 diskette. If you'll send me a self
addressed/stamp disk envelope, I'll give you my DOS 3 Master for free.

I have tried to use the 130xe+ Assembler with some Emulators on the
Win98-PC, but it didn't worked.
Further I am interessted in using the speed of the Falcon and the Harddrive
for Assembling bigger Sources!
I mentioned that I use MiNT, to tell the people that I can use *any*
UNIX/LINUX CrossCompiler as long as the Sources of the Compiler come along.

Hope somebody can help me...

Salut,
Daniel

Hi,

.> Look for a copy of Mapping The Atari, revised edition. As i recall,
the
> XL/XE computers have a memory location that points to a table which maps
> key scan codes to ASCII. Normally it points to a QWERTY table in ROM,
> but you could have a table in RAM for AZERTY, Dvorak or other keyboards.

This is the keymap as found in the ROMs. The pointer you're looking for
is at addresses 121 and 122.

```
KEYMAP: .BYTE $6C,$6A,$3B,$8A,$8B,$6B,$2B,$2A
.BYTE $6F,$80,$70,$75,$9B,$69,$2D,$3D
.BYTE $76,$80,$63,$8C,$8D,$62,$78,$7A
.BYTE $34,$80,$33,$36,$1B,$35,$32,$31
.BYTE $2C,$20,$2E,$6E,$80,$6D,$2F,$81
.BYTE $72,$80,$65,$79,$7F,$74,$77,$71
.BYTE $39,$80,$30,$37,$7E,$38,$3C,$3E
.BYTE $66,$68,$64,$80,$82,$67,$73,$61
.BYTE $4C,$4A,$3A,$8A,$8B,$4B,$5C,$5E
.BYTE $4F,$80,$50,$55,$9B,$49,$5F,$7C
.BYTE $56,$80,$43,$8C,$8D,$42,$58,$5A
.BYTE $24,$80,$23,$26,$1B,$25,$22,$21
.BYTE $5B,$20,$5D,$4E,$80,$4D,$3F,$81
.BYTE $52,$80,$45,$59,$9F,$54,$57,$51
.BYTE $28,$80,$29,$27,$9C,$40,$7D,$9D
.BYTE $46,$48,$44,$80,$83,$47,$53,$41
.BYTE $0C,$0A,$7B,$80,$80,$0B,$1E,$1F
.BYTE $0F,$80,$10,$15,$9B,$09,$1C,$1D
.BYTE $16,$80,$03,$89,$80,$02,$18,$1A
.BYTE $80,$80,$85,$80,$1B,$80,$FD,$80
.BYTE $00,$20,$60,$0E,$80,$0D,$80,$81
.BYTE $12,$80,$05,$19,$9E,$14,$17,$11
.BYTE $80,$80,$80,$80,$FE,$80,$7D,$FF
.BYTE $06,$08,$04,$80,$84,$07,$13,$01
```

The first 64 values are ATASCII for "normal" chars, the second 64 for
shifted chars, and the next 64 for CTRL-chars.

For example, to change the key-mapping for the "q" key to a, you'd have
to...
--> replace the occurrence of the ascii value for "Q" ($51) with "A"
($41)
--> replace the occurrence of the ascii value for "q" ($71) with "a"
($61)

Now poke these new values at page-6 (address 1536 and up), then type

POKE 121,0 : POKE 122,6

(remember to do this on the same line , then hit "enter", or you'll be stuck with quite a strange keyboard mapping after the first poke).

I could make a simple machine language program to do this that would be usable at bootup, if this seems to be problematic. However, I'd need some additional info:

* what are the exact differences between the "standard " querty and the azerty keyboard? In other words, what keys would you like to have replaced by other keys? Does this include the characters that you get when you press "control"?

* what type of software do you plan on using? This is important because pressing "reset" will normally restore the default keymap. In fact, restoring the default keymap is done when opening any of the "E:", "S:" or "K:" devices. I could probably work around this, but I'd have to know that the mechanism I use in order to alter the keymap at reset does not conflict to the software you're using.

* what's the type of ROM's you're using? If you could provide the numbers as given by the ROMCRC program I wrote (see http://ch.twi.tudelft.nl/~sidney/atari), I could make the patch more robust.

* for the sake of completeness: if you happen to own an EPROM programmer, you could of course produce a ROM with the AZERTY mapping as default. Please contact me privately if you plan to do this (because you would also have to change some ROM checksums).

Best regards, Sidney

PS. It's also possible to modify function key mappings, but you probably don't own a 1200 XL and furthermore, the azerty keyboard should be no different in that respect.

594. Action! to trade

Newsgroup: comp.sys.atari.8bit

Have a new in the box Action! cart and
manual. Shrink wrap has been removed to
permit testing of the cart (worked fine).

Will trade for similar new Basic XL cart/manual
package. Must be Black cart, version
1.03 or later. (Actually, I don't think there
is a "later").

If interested, email me.
Thanks,
Larry White

595. Hardware modification

Newsgroup: comp.sys.atari.8bit

Message-ID: <oDSg4.1215$j63.262039@news1.rdc2.pa.home.com>
Source record: 47229

IF, the 6502 could be run at a multiple of 1.79MHz, (like...7.16MHz) and
that frequency was divided back down to 1.79MHz to feed to the video
processors, would that buy anything to the system?

My guess is that it would allow the processor more cycles before it was
interrupted with DMA stuff (60X a second)

true? or not?

tony

596. Airball Manual online

> that frequency was divided back down to 1.79MHz to feed to the video
> processors, would that buy anything to the system?

Extra CPU cycles, obviously... But the problems are quite overwhelming.
Some I can think of:

* as you state, you'd have to multiply processor speed only.
* the bus, RAM and ROM were never designed for faster CPU access. You'd
have to allow for wait states on memory access, which basically destroys
all advantage on a processor like the 6502. It doesn't have a cache, so
if memory can't be overclocked (which I presume it can't), your maximum
speed gain would be only two (as every instruction needs at least 1
memory access for the fetch)
* in the ROM's, there are a few places where timed loops are used, i.e.
the correct workings seem to depend on an exact time spent in the loop.
Things could get hopelessly complicated here.

Personally, if someone pointed a gun at me and said "choose between
making the Atari into a 7.16 MHz computer and making the Atari a
dual-6502 system", I guess I'd go for the latter :-)

I'd probably even offer to make a 6502 with 16-bit word size rather than
quadrupling it's clock speed, if that be a measure of how desperate I
think it is :-))

Best regards,

Sidney

New RAM and ROM. Wouldn't the faster access simply free up the bus faster?
since the Atari basically shares the bus with the peripheral chips? either
they have the bus, or the CPU does.

>It doesn't have a cache, so if memory can't be overclocked (which I
presume it can't), your maximum

I would assume a replacement for the -250 or whatever speed the ram & roms
are.

> * in the ROM's, there are a few places where timed loops are used, i.e.
> the correct workings seem to depend on an exact time spent in the loop.
> Things could get hopelessly complicated here.

And since we're replacing the ROMs.....but your point of increasing timings
from 8-bit values (256 counts) to a 16 bit count, WOULD complicate things.
>
> Personally, if someone pointed a gun at me and said "choose between

But 16 bit word sizes don't help the video chips since they access memory
with 8 bits of data.

Hi,

I have two SLM804 printers gathering dust in a corner since I do not have any Atari system. I'd like to have any programming info available on those printers, especially the connector's pinout (I also have the SLMC804) because I want to use them on a PC. Maybe even write a Linux (or Ghostscript) driver for it.

Thanks.

Centipede for 5200 kicks butt! I like how it has the same sound
effects as the arcade game since both use the POKEY chip. As a matter
of fact, I rather run the "Glenn the 5200 Man" on my 8-bit emulator
instead of the actual 5200 emulator :)

I like to know more on how Glenn ported the 5200 games to work on the 8-
bit computer. I'm researching a project on running 5200 games on the
800 which basically "hacks" the game as you load it. Only because some
of the 5200 carts are better than the 8-bit versions (i.e. Centipede)

Problem is all the other chips count cycles or derive their functionality
from the system clock. When manufacturers of the chipsets in the Atari say
they are 2 mHz devices, they are pretty much 2 mHz devices.

So, things like SIO timing will be munged, all sounds out of the POKEY chip
will be off. Some things are tolerable, like faster keyboard scanning, but
if for instance you managed to double the clock rate of the 6502, video
interupts would occur 120 times a sec vs 60. All this could probably be
fixed by dual clocks and a rewrite of OS, but that is a lot of work:
Probably require more time then anyone has available.

Deviating just a pinch from 1.79 mHz means you lose the color coding so IMO,
you lose more then you gain.

I know that M.U.L.E. is "paddle-compatible" -- so does that mean that with an 800XL's *TWO* joystick ports, you could hook up two sets of paddles and play a simultaneous 4-player game of M.U.L.E.?

Nope.. at least 1 joystick is required for the "planting" phase
where you lead the mule around. For the "market" phase where
you sell stuff to the other players you can use the paddles because
all that's required is up & down motion and a button. This means
that you can only have a max of 3 human players on an 800XL.
Also, IMO, the paddles don't work quite as well during the selling
and buying when you want to fiddle around and fake out your opponents
to drive the price up, or bring it down. This is definitely one
reason to keep around a working 800, as there is no game in existence
that I've seen that compares to 4 player mule.

For maximum versatility (and they're relatively "cheap" to buy, also!) you should probably get an Atari 800XL. It has 64k memory. However, it has two joystick ports, as opposed to *four* joystick ports on the Atari 800. Most Atari 800s have 48k memory, however, and thus you could not play games that require 64k.

To be fair, it probably wasn't the programmer's fault. It could have
been I suppose, but I suspect some marketing wonk wanted a whole new
"easier" look and feel to the DOS. As proved later by DOS 2.5, the
good old DOS 2 user interface could be adapted perfectly well to
supporting the enhanced density 1050, so it must have been some
marketing wanker.

According to the FAQ, the 800XE was nothing but a 65XE with Enhanced
Cartridge Interface (like the 130XE). Quite popular in Germany (and
Eastern Europe, IIRC) in the late 80's, mostly due to the low price
(since the Tramiels took over, the 8 bit series always was cheaper than
the C=64).

Normally you get get a disk stored as a file in a DCM format. Then
you run DCM on your Atari and make a new disk from it. But you can't
do that since you have no DOS whatsoever or terminal software, DCM or
anything. What you need is to have a system disk mailed to you
(preferably more than one, like DOS 2.5, MyDOS, maybe even SpartaDOS
and also some terminal software and DCM utility). Otherwise the only
way is really to hook up a 360KB PC floppy drive to your PC and use a
special utility to write a disk image out to a real disk. Heck, I'm
not even sure the program can write like that. I've heard of one that
can read Atari disks in such a drive and make ATR files out of them or
something.

Otherwise you need to build Steve Tucker's ProSys cable, hook the 1050
up to you PC and make your disk that way.

Been a long time since I fooled with it, but you should be able to get
something compatable that works with just one or two extra steps.

Better come clean up front, I don't currently have a Pro cable, I took it
apart to convert it into a SIO2PC cable for someone<???>. I don't currently
have a copy of APE either, so a lot of stuff is from foggy memory.

But if memory serves, once you get a copy of the disk with the Pro cable,
you can move files to and from a normal .ATR disk or your IBM with either
APE or several utilities. Every emulator except Xformer uses the .ATR
format. To convert between an .ATR and .XFD format, you just strip the 16
byte header off of the .ATR. It is pretty easy to do this with DEBUG.COM,
all you have to do is set the start of save location and file size by 16
bytes and save the file. Someone probably has a utility that does it by now.

But for all I know Xformer has .ATR support now. I know there was a problem
with emulators being able to use the proprietary .PRO format, but for some
reason no emulator writer every bothered to add support for the Pro cable so
you could do what you are talking about w/o jumping through hoops.

> just wire to a DB9 to start with?
I don't know, first ones had DB9s. Maybe Steve Tucker is secretly the heir
to a DB25/DB9 adapter empire and all this stuff with APE and PRO is just
part of his master plan to take over the universe.<grin>

You still won't be able to get useable images of copy protected disks. But
worst case, if there is no sensitive material in the data, you could put the
stuff on a web page and someone with a real Atari and Pro cable could copy
the files to Xformer ready XFDs for you. At one time, there even was someone
advertizing the service, something like send him all your disks and he will
convert them to .ATRs on 1.4 meg floppy.

It can write with the resident disk handler which is internal to the 8-bit and needs no disk operating system; this is how DOS is booted and how DCM writes out those images from a file. We could e-mail him the data statements and BASIC program code to type in for generating a bootable disk but the frustration factor would be enormous! I prefer to just mail him a floppy or so.

Cross-posted to: comp.sys.atari.8bit,

Richard: Thanks for the feedback. FYI, Xformer does support .atr files with no need to convert to .xfd. I no longer have any protected software, so no problem there. Years ago I dabbled in some programming for the Atari, and a lot of what I found in the closet was my own stuff. I'd just like to have it on disk images for posterity. When I gave all my Atari stuff away, I hadn't used it for so long I didn't think I would miss it, but now that it's gone, I wish it weren't! But I'm not about to get started again in actual Atari equipment, as our house is already bulging at the seams with four computers! My Atari corner was immediately usurped by my husband and his Compaq! I also have an almost complete collection of Antic and Analog Magazines (with disks) and quite a few old Compute!s with disks also. Haven't decided just what to do with this stuff. The other stuff I gave away included the 130XE, Astra Big-D Drive, Commodore monitor, Alien Voice Box, Koala Pad, PR-Connection, Midi Interface, etc., and software galore.

Just made a trip to Skycraft and couldn't get the exact chip required for the ProSystem cable. Got the next thing to it, and it was only 75 cents, so guess I'll give it a try. I sure don't want to pay $59.99 plus shipping for the readymade cable.

Mathy is absolutely correct!
But IF you ever do want to append, it is nearly the same in MyDOS:
<C> for copy
respond <D2:KEYPAD.EXE, AUTORUN.SYS/A> <RETURN>
this copies keypad.exe onto the end of autorun.sys as a single file.

It's just plain disturbing to here people still talking about playing the
game M.U.L.E., in the year 2000 no less.
:)

[as a side note, isn't that the one that you can play on the 800Xl with
four players, and two of them will just randomly do stuff because there
are only 2 joystick ports, and the memory locations for joysticks 3 and 4
are used for other things?]

I also got my 800XL and 1050 with DOS 3. I used that combination for
YEARS! I guess I just didn't know better at the time.

There are two sites that I would recommend that you visit. The first is:

http://www.best.com/~hmk/index.shtml

This is a virtual museum dedicated to both Atari and Commodore Computers.

The other site that I would recommend is the Atari Historical Society. The web page address is:

http://www.atari-history.com/

I hope that you enjoy the sites! :)

I suggest that you try the following web site:

http://www.ti.com/calc/docs/994a.htm

This is Texas Instruments web site with regards to the TI-99 and it mentions
an address to contact for parts. Hopefully they have the part that you need.

Good luck.

Hi Alan,

Try Redmont "Weird" Cables, if they don't have it, they can make it. In
fact they stock a full line of cables for Atari computers, all types:

http://www.redcab.com

Curt

Assuming you know the hot from cool ends on a soldering iron, it's pretty
easy to build your own. The monitor port pin-out (looking at the port) is:

v ----- this is supposed to indicate the notch on the plug/bump
on the port
3 1 1=composite luminance 2=ground ("earth" for Brits :)
3=audio out 4=composite video 5=composite chroms
5 4

2

If you buy a Radio Shack DIN-to-RCA adapter: 1=red, 2=n/c (shielding only)
3=black, 4=white, 5=yellow

BTW if you use a mono monitor (my own favourite), you get better results
by hooking up just the luminance to the monitor's video input

Alternatively, the cables for the Commodore 64 work just fine.

> fixed by dual clocks and a rewrite of OS, but that is a lot of work:
> Probably require more time then anyone has available.

Why? The graphics SYSTEM is tied to the color clock, for its display
creation scheme, not the 6502. I would think that since the chips have DMA
capabilities that you would be able to set them up and remove the 6502 if
you wanted, Heck, they stop it anyway to do their thing.

All I'm saying is if it were possible, and you ran the 6502 off a multiple
of the 1.79MHz clock, but still ran the video system off the same 1.79MHz
clock, wouldn't the 6502 just run say 3-4 times longer before being
interrupted by the video system?

In most applications, clearing memory, displays, buffers, you usually write zeros to each byte. To clear the default text screen, you fill it with spaces, ASCII 32, so the internal chset is rearranged so that the space character in the font is number zero. Number-Caps moved down by 64, gfx chars up by 64, lower case not moved. It all just takes a little bit twiddling in assembly.

NOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOO

Get MyDOS 4.53/x, that way you NEVER, EVER, EVER AGAIN have to append ANYTHING
to you AUTORUN.SYS file.

You rename AUTORUN.SYS to SOMETHIN.AR0 (A AHR ZERO) and KEYPAD.OBJ to
KEYPAD.AR1

I believe this *.ARx thing David (I forgot his last name) added into MyDOS
4.5x is one of THE best things added to MyDOS in years.

I do not know if you can get to alt.binaries.atari but I posted a really fast
and not very "CPU time consuming" mousedriver (plus the docs on how it works)
there a month ago. Traffic isn't high, so it might still be there.

IIRC Missile Command works with the mouse (switch MC to "TB") and the AMIGA
mouse has some pins reversed.

Aside from pricing his stuff way too high, I think Gene is probably mostly an honest seller. I have bought from him before. Since he was preparing to "move" to a different location, it is fairly likely that he has gotten the order screwed up in the confusion of his "move". I'm just guessing here, but that's my opinion. I think you will probably be able to resolve your order -- either with a refund, or with receipt of the merchandise -- within the next few weeks. You may have to "track him down" if he gets a new address (either geographic or "email") though.

Hi there.....I have been interested in collecting 8-bit computers for a while now,mainly Coleco Adam and commodore.I have been wanting to start collecting Atari computers.Can anyone tell me which is a good starter computer? Which was the latest? Sorry for the silly questionsbut i dont know much about them right now.Thanks alot!

Russ

Can you telnet to Tom Hunt's site (telnet://cth.tzo.com)?

He has this problem licked.

You might do better to ask in a different newsgroup. Be glad to tell
ya how to hook up a monitor to an Atari 8-bit computer though.

662. Munoz's SIOCopy

Newsgroup: comp.sys.atari.8bit
Date: 2000-01-20 00:00:00 UTC
From: rhamiiton5@aol.comedy.com
Message-ID: <20000119221346.03579.00000335@ng-cn1.aol.com>
Source record: 47073

Does anyone know anything about functionality of Mike Munoz's SIOCopy from '94?
It was a PC .exe utility which used a cable similar to the XFormer. He also did
some SIO2PC stuff but this is different. Plans are shown below:
Cable specifications: << Pinouts:
IBM Parallel Port Atari SIO name

1 -----------------> 7 command/
14 <---------------- 5 dataout
16 -----------------> 10 vcc/rdy
17 -----------------> 3 datain
24 ----------------- 4 gnd
25 ----------------- 6 gnd

Connector Specs:
IBM Parallel Port DB25M 25 pin male d-shell
(view as if you were plugging the connector into your face)
1 2 3 4 5 6 7 8 9 10 11 12 13
14 15 16 17 18 19 20 21 22 23 24 25

Atari SIO Molex 13 pin
(view as if you were plugging the connector into your face)
1 3 5 7 9 11 13
2 4 6 8 10 12
Notes:
(1) Keep the wire length less than 3 feet. >>

-Ron

I started life with nothing, and still have most of it left...

663. 130XE schematics

Newsgroup: comp.sys.atari.8bit
Date: 2000-01-20 00:00:00 UTC
From: Anthony Rudzki <Arudzki@home.net>
Message-ID: <Gnwh4.2679$j63.434327@news1.rdc2.pa.home.com>
Source record: 47074

Does someone have a scan of the memory section of the 130XE? I have a schematic for the 800XL, but it doesn't show the bank switching circuitry, which is what I'm interested in.

OR...

Did someone do a 1 Meg SIMM upgrade for the 800XL?

Thanks

Tony

Are you sure? PC parallel ports are TTL devices (approx. 0V..5V) while SIO is (I think) -12..12V ... On first sight, this looks to me like it would destroy the parallel port.

Actually POKEY uses 0/5V for serial comms, which I believe is
the root of this facination for attaching a serial port to a
parellel port :)

And I thought only XFormer did this...

Welcome to comp.sys.atari.8bit, the Usenet newsgroup for discussion about the
Atari 8-bit family of computers! These include the 400, 800, 1200XL, 600XL,
800XL, 65XE, 130XE, 800XE, and the XE Game System.

Many topics are covered over and over again. To help alleviate this trend,
several people volunteer their time and energies by maintaining Periodic
Informational Postings for this newsgroup. Please take a moment to refer to
these documents before posting to comp.sys.atari.8bit. The answer to your
question may already be readily available!

Users of comp.sys.atari.8bit actively maintain the following Periodic
Informational Postings:

Atari 8-Bit Computers: Frequently Asked Questions / Michael Current

Here's another question.. Can I run the TDLINE.COM from SpartaDos 3.2d or whatever under SDX?

SDX 4.22's TDLINE is not Y2K compliant.

OK Larry, you've got me interested. I'd really like to use my SCSI zip drive for my 8 bit, but don't you need some modifications to use a SCSI zip in a typical SCSI bus because a zip doesn't provide termination power? Also, I suppose I'd need to find a 50-to-25 pin coversion cable (and probably a gender changer too). Do you (or anyone else reading this) know of anyone who has actually done this and has a working black box with zip drive? Thanks! -Dan

The cables are fun to make, one, maybe two. But by the time you've made 2 dozen or so the prospect of soldering another one makes my flesh crawl.<grin>

If you see someone offering a SIO2PC cable or PROSYS cable for more then ~$25 that just means they are already dizzy from sucking solder fumes and would really rather do anything but make another one. The 30 minutes it takes to put one together has to by offset by enough money for dinner at The Sizzler and a movie afterwards to motivate you.

If the 1489 doesn't work let me know. I live ~15 minutes away from JDR Microdevices so I stop by there almost weekly. They also have a net presence, something like www.jdr.com but minimum order is $5 or $20.

There really should be more PROSYS cables making it to the 2nd hand market, you buy or make the cable, transfer all your software, don't need the cable anymore. I don't know why more people aren't doing this.

AFAIK, there were two replacements sold commercially. The first was from DataQue, called the Turbo816. It included a modified OS to take advantage of some of the new opcodes, plus a memory expansion board (it's been a while, so some of this is a bit fuzzy).

The second was sold briefly by Fine Tooned Engineering. It was called the Sweet 16, and was a single, small PC board with a logic chip on the underside and the CPU on top. It plugged into the CPU socket.

I know of no software that took advantage of the 65816 other than a spreadsheet cart sold by DataQue. I have fiddled with programming the 65816, using John Harris' excellent MAE. But I never produced any usable code. Besides, any software would have to be CPU-aware because of the paucity of installed '816s.

Hope this helps,

David P.

For faster service, Please direct all replies through E-Mail to Ben at:
atari@benjamin.net or bensmith@teleport.com instead of NewsGroups as I
find it hard to keep up with NewsGroups.

e-mail: atari@benjamin.net

Click for WebSite!

I've added more and will be adding more Hardware, Software, Books and
Accessories for Classic 8 Bit and Atari ST. So checkout what's new on
my WebSite. In Fact, check it regularly as my Catalogs are updated
regularly. Customer's are served, first come, first serve! I have 6
different Catalogs, and my SoftWare Catalogs are my largest. They have
the biggest Byte Count. You should see my inventory! I have TruckLoads
of HardWare, Boxes & Boxes of Software & Libraries of Books & Reference
Material for the Classic Atari 8 Bit & Atari ST! And remember, if you
can't come see me today, come see me tomorrow!

also, if you live in Portland, Oregon, interested in Atari and want to
meet with other Atarians. Read the Ad near the bottom of this message.

FREE Catalogs for Classic Atari 8 Bit & Atari ST Computers! Hard-
Ware, SoftWare, Books & Accessories! View Atari Catalogs on the Web at
http://www.atari.benjamin.net And Jump to my FTP site linked to my Web
Site so you can Download Free Catalogs or FTP directly to my site at:
ftp.teleport.com/vendors/bensmith/ If you can't get Catalogs that way,
Feel free to Request catalogs through E-Mail. Really, it's not an
inconvenience. I do ask that you specify Atari 8 Bit, Atari ST or Both!
Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail.
Please let me know if I can attach text files to your E-Mail. Catalogs
are just regular ASCII text files so you can download them into your
text editor and view them, edit them or print them out! It would make
things easier for me if you take my Catalogs, load them into your text
editor, delete what you don't want and E-Mail me the rest! To expedite
things, include your complete Mailing address so I can figure your
Shipping/Postage & Handling. I'll be back after the weekend.

If you have an Atari and live in Portland, Oregon. U.S.A. or vicinity,
you are cordially invited to attend a Meeting of the Portland Atari
Club. You don't have to be a member to attend. Now we've moved our
meeting to a new night. Same Bat Time! Same Bat Channel! We meet the
2nd Thursday of each Month. Our Next meeting will be Thursday, February
10th, 7 pm at the Pizza Baron at 2604 S.E 122nd Avenue in Portland,
Oregon. We're trying to rebuild our club so we're looking for Atarians

who wan't to get involved in supporting other Atarians. If your interested, call Ben at (503)256-9974 and by all means, come to our meetings on the 2nd Thursday of the Month. For more info, surf the Web@

http://pac.pdxweb.net

e-mail: atari@benjamin.net

For more information or directions, please call our Vice President Ben Smith at (503)256-9974 See you there!

You should know I regularly add more Atari stock items to my catalogs and this weekend is no exception. A list of my new ST Software I just added to my Catalog are listed below. In case your wondering why my Catalogs (below) are formatted to 38 Columns. They are made to be compatible with the lowest common denominator. Also known as the Atari 8 Bit. Once the Classic Atari User converts the Carriage Returns to Atari 8 Bit.

Please Direct all Replies Through E-Mail to: atari@benjamin.net or bensmith@teleport.com. If you can't reach me at benjamin.net see my E-Mail/Web info in my Signature at the Bottom!

I think I used the paddle.
When turning the paddle the selected area scanned the whole screen
from the upper left corner over the screen to the right. Then down one
row and from the left to right again. And so on.

That is how I remember it. But it was some time I played it.

I wounder who is going to make the steel box that it comes in? it is
basicly a steel box about 12" cube. has 5 slots and a circuit board
with buffer and power supply on it.
The only cards that I know of are a memory card with 64K on it and a
Z80 card with no software for it. You could apparently have 4 memory
cards. some thing to to with bank switching somehow. I got mine from a
guy who worked at Western Digital? they where going to make a
harddrive card for it.

I have a very nice ICD Multi I/O (MIO) 1 meg version for sale.
It's in excellent working condition.

It comes with lots of extras, including a Controller board for
connecting a hard drive to the MIO.

This item was suppose to be sold but things did not work out with
the buyer so I am putting it back up for sale again.

Price is $250.00 FIRM.

For detailed information about the MIO and what is included then
e-mail me at: phantomm@kih.net

Seriously interested folks only please.

Actually, I believe you are mistaken. Elementary Electronics *did* morph into Creative Computing. My dad used to subscribe to EE (he was interested in refurbishing vintage radio receivers and they had a column called "Antique Radio Corner". Another favorite was "Kathi's CB Carousal"). For awhile, it was renamed Elementary Electronics-Including Creative Computing, and then eventually became just Creative Computing. My dad let his subscription run out after that, as he wasn't interested in a 100% computer magazine.

This is an interesting site. I see where you reduced all the images to bring down the bandwidth. IMO you would get better images at similar size by dithering down the original scans to 16 color GIF's. There are surely many programs which could batch process your 177 images if you stuck them all in a directory.

Hi everybody!
I've been messing around with SPARTA & MYDOS
I think I could do it better with their own manuals
Does anybody know where can I find in the iNet a .PDF, .DOC, .TXT, .*
with info about using these DOSes?

Thanks a lot!

Luis P. Baeza Q.

PD: Please post here or send eMail to lbaeza@yahoo.com

703. 1090 XL info from the Atari Museum

Newsgroup: comp.sys.atari.8bit
Date: 2000-01-21 00:00:00 UTC
From: Greg Goodwin <drclu@swbell.net>
Message-ID: <38890CFF.896@swbell.net>
Source record: 47114

Hey folks,

Since we are talking about it, it seems as though we have some good
information to work with thanks to Curt Vendel and the Atari Historical
museum.
Seems we have some good material to work with. If we could create
the specs to the board, maybe a TRUE hard core Atari hobbyist could
build a 1090 XL module from scratch.

Anyway, the info...

Doctor Clu

http://www.atari-history.com/1090xl.html

THE ATARI 1090: XL EXPANSION SYSTEM

ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ This unit was designed to provide the Atari XL series of home
computers: 600XL, 800XL
(Unreleased 1400XL & 1450XLD) with expansion slots. The XL Expansion
System contained 5 8-bit PBI
(Parallel Bus Interface) slots which could accommodate a variety of
expansion options. Also a control line
was added to the PBI to allow a "BUS MASTERING" card such as an
alternative CPU card to take over the
Bus and in effect, take over the computer. This would have allowed for
alternative CPU configurations like
an Intel 8086 processor for IBM compatibility or the 65816 processor
which was the 16-bit version of the
6502 processor used in all of the Atari 8-bit series computers.

ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ The XL Expansion system appears to have been in a finished and
completed form.ï¿½ï¿½ The
case was complete and although they are scarce for one reason or another
the top covers were also
completed.ï¿½ï¿½ Several cards were completed or near completion and data on
the product was delivered to
all Atari dealers.ï¿½ï¿½ The XL Expansion system would have opened the doors
for the Atari 8-bits and
allowed them to grow in all new ways. However in 1984 Atari, Inc was
acquired by Jack Tramiel and like so
many innovative Atari projects, the 1090 XL Expansion system made it to
the garbage dumpster and not
the Atari Retailers shelves.

ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ The Atari 1090 XL had several expansion card specifications layed
out for it, however only a few

were ever fully designed and built, here are images of three of these
Atari made EXPANSION CARDS.
ï¿½

http://www.atari-history.com/cards.html
ï¿½
Atari 1090 XL Expansion Cards

EXPANSION CARD #1:

Atari 1090 CP/M Module.ï¿½ï¿½ (This was to be the 1090 version of the
"Sweet-Pea" which was
an external box called the Atari 1060 CP/M Add-on.ï¿½ï¿½ The 1090 CP/M card
is the Atari
1066.)ï¿½ï¿½ This expansion card would have allowed an Atari computer to run
software written
for Zilog Z-80 processor CP/M (Command Processor/Module) computers.ï¿½ï¿½
The card
contains a Zilog Z-80 processor and support circuitry.ï¿½ï¿½ However this
board has not been
able to be tested since no software drivers have yet been found.ï¿½ï¿½ The
card does contain an
expansion header, it is unknown whether or not this header may have been
used for a
daughter card with RAM or perhaps a floppy disk controller board or some
other feature.
ï¿½
ï¿½

EXPANSION CARD #2:

Atari 80 Column Video Module.ï¿½ï¿½ This is a bare unfinished board.ï¿½ï¿½ It
capabilities are
unknown.ï¿½ Whether or not it had character attributes and multiple split
screens similar to the
Atari Corp XEP80 80 column/parallel port module is unknown.ï¿½ï¿½ However it
is most likely a
necessary board in conjunction with the CP/M module since most CP/M
software would have
functioned more properly in an 80 column mode.
ï¿½
ï¿½

EXPANSION CARD #3:

Atari 64K Memory Module.ï¿½ Up to 3 of these modules could have resided
within the 1090XL
expansion chasis.ï¿½ They would be daisy chained together via the
expansion header located
in the top center of the card.ï¿½ The card had 2 "Personality" modes.ï¿½ One
mode was the "Bank
Switching" mode for use with the 800XL, 1400XL and 1450XLD.ï¿½ The second

mode was the
"1064" mode which would have allowed a single memory card to act as a
1064 expansion
module.ï¿½ (The 1064 Epansion module was a 64K box which could only plug
into an Atari
600XL giving it 80K of total memory).
ï¿½
@>-->----------------

Now that's interesting.. I didn't know the 600xl expanded to 80k.. I
thought it expanded to 64k. :)
ï¿½
ï¿½

704. Re: SpartaDOS TDLINE

I got the TDLINE from 3.2g and it reports the correct day of week but the
date looks like this:

01-21-:0

Note the colon in place of the first zero in the year. Is this how it
should look?

I can answer your fourth question... Yes... I use 16mb (65536secs x 256byte) ATR images all the time both with an emulator and my real 800xl going through APE. I am currently building a mega BBS which will have 8 16mb drives online - but at my rate of speed it will be 2010 before it goes online. Sometimes I run it late at night after 11pm EST. To get there go here > telnet://cabell.tzo.com

Sorry I really don't know the answers to your other questions.

Hi

I'm looking for information about the format used for large disk images.
By large I mean disk images of the order of 7200
sectors (yes seven thousand two hundred not 720 sectors). I'm working on a
project that requires large amounts of disk and I've been considering using
a single massive disk image. I specifically need to know:

- What format are these in if any (Are they just a linear sequence of bytes
equal to the number of sectors*128 ?)
- Can I access one via CIO with sector get's and put's (I dont need DOS).
- Does the CIO stop you accessing all 65536 theoretical sectors available ?
- Has anybody seen/used an 8 MB (65536 sector) disk image ?

Thanks
Peter

The ATR format is well documented in the SIO2PC documentation.
Using the page 3 registers and OS calls, you can directly access all
65535 sectors. Using a modern DOS like MyDos or Spartados, you
can access the entire image using regular dos file routines.

713. i Conference Access in Dallas Area (JYBOLAC Review)

Newsgroup: comp.sys.atari.8bit
Date: 2000-01-22 00:00:00 UTC
From: Greg Goodwin <drclu@swbell.net>
Message-ID: <3889C1A2.3064@swbell.net>
Source record: 47124
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st,rec.games.video.atari

REVIEW of this BBS / CONFERENCE area..

When I saw this on the Atari 8-bit Newsgroup, I was amazed. I couldn't figure out at first who this was that was kind enough to set up a local dialup shell that would do text versions of E-mail and newsgroups that an Atari 8-bit (or above) could dial into. Simply amazing!

Come to find out it was one of many BBS's I had contacted in the Dallas area called the FAMILY NET (972-496-0650). I wasn't sure that it was still running, and I didn't think a BBS would carry E-mail capibility anymore, but apparently once you get validated a few options open up. :)

The E-mail account works very quickly. I posted a test message from FAMILY NET to my PPP mailbox at swbell.net. The message arrived between the time I stepped from my Atari 400 to my Macintosh (the matter of only minutes). So the matter of minutes.

The newsgroup, both Atari 8-bit and ST are there. Knowing this is there, I would like to ask for the Atari video games newsgroup. (Have to keep up with the latest Lynx/Jaguar games!) I can at least say that the Atari 8-bit newsgroup was there and with some very recent messages. I have yet to see the messages that I posted on the newsgroup at the FAMILY NET arrive here, but given that the E-mail works, the Newsgroup messages are probably sent out but on a timed basis.

I tried the other ways of logging on...

> telnet://209.217.2.202

Works fine! Just like logging on to a BBS, and this one, once again, has the Atari-8bit and atari-st newsgroups.

> http://209.217.2.202

Interesting interface. Haven't had much luck getting it display the message areas, but still has potential.

> nntp://209.217.2.203

Not familiar with nntp. Would like to know more about that.

So that's the word. Atari 8-bit users in Dallas now have a place to go to check E-mail and newsgroup messages. With this feature, I now have 85% of what I need to do on the 8-bit. Better make it about 95% actually, since I do must web browsing, what little I do, at work. :)

Take care, and to all those Dallas Atari fans, contact me and I'll
let you know of our ATARI meeting happening Saturday the 29th!!

Look forward to hearing from you,

Doctor Clu
Leader of the Pack at JYBOLAC
(Just Your Basic Online Atari Computer)

714. MIO HD problem

Newsgroup: comp.sys.atari.8bit
Date: 2000-01-22 00:00:00 UTC
From: "Vidar \"Hawk\" Olavesen" <olavese@online.no>
Message-ID: <rSni4.10622$in5.176424@news1.online.no>
Source record: 47125

I just plugged up the MIO to try a little coding, but the HD didn't boot. My setup is a 256K and a 1Mb MIO connected to an Adaptec 4000a interface. I use a couple of KC-30 Kyocera drives and thought the MIO would set itself up as it was stored on the HD.

Any suggestions ? I think SCSI Lun and ID was 0,0 and 0,1 for the second drive. Is this correct ? I've tried others too, but can't seem to find the files that was stored on my HD. Actually nothing happes, except a 163 error I think it was.

Anything to help me on the track to get it up again would be greatly appreciated.

Thanks

Yes, the XE cartridge came out in 1988 and looked way better than the old
5200 style version that went around on pirated disks earlier. The XE cart,
in fact, is the best version I have ever seen, with the possible exception
of the Nintendo NES version. -Satcom2

> I know of no software that took advantage of the 65816 other than a
> spreadsheet cart sold by DataQue. I have fiddled with programming the
> 65816, using John Harris' excellent MAE. But I never produced any usable
> code. Besides, any software would have to be CPU-aware because of the
> paucity of installed '816s.

On The C64 the CMD SuperCPU Card is a very cute thing. The card gives you 16MB of directly adressable and programmable RAM and 20Mhz clock frequency. Amazing stuff! It is still being sold. Look at www.cmdweb.com for details. At the moment there are quite a lot of tools being optimized for it. One example is the Byte Boiler Cruncher, which uses a kind of LZ77 Algorithm and is as fast as an RLE-compressor on a usual C64 (which is very fast). As a comparison: Usual LZ77 or LZ78 crunchers need half an hour (some older ones even a whole night) to crunch... with this amount of memory and CPU Speed it was possible to shorten the time to a few seconds!

You should really try to get something like that for your Ataris!!!!

-Wanja-

--
In the 1960s you needed the power of two C64s to get a
rocket to the moon. Now you need a machine which is a vast
number of times more powerful just to run the most popular GUI.

Actually, there are 4 cards that exist in prototype form.

Ram
CP/M
80-column video
serial/parallel interface

You could only use 2 memory cards in conjunction with each other.
The cards had a switch that let you select between "1064 mode" and
"Bank-select mode". By putting two cards in 1064 mode, I have been
able to generate a ram-disk using MyDos. If anyone wants some more
info, they can email me at: editor@atarihq.com

It should as long as the two drives are physically addressed as 0 and 1
(with jumpers on the drive) and the drive addressed as 0 is the original one
that had the MIO cfg on it.

ID LUN PhysAddr
drive 0 0 0 0
(mio cfg on this one)
drive 1 0 1 1

This comes from my memory which doesn't serve me all that well anymore...

Of course make sure you are cabled properly

Hi Tony,

> Is there any reason to use DRAM for memory upgrades?
>Could an SRAM be used instead....

Nothing stopping you using static RAM at all.

Most upgrades use DRAM because it's a LOT cheaper than SRAM, plus the chips
tend to be pin compatible enough to make such upgrades easy.

>computing power that we used for the moon project was about
>equivilent to a single average 486 class PC....

If we're talking about ALL the computers used during the design and implementation of the entire Apollo project combined then that's probably about right.... ;-)

The computer used on the Apollo space craft itself had little more computing power than the average digital watch of today. It was built using early discreet digital ICs (not dissimilar to TTL ICs, custom made for NASA) and was just powerful enough to do the job it was intended for (it had to be as small, light and power efficient as possible).

After all, all it was expected to do was make course/burn calculations and fire the main engine from time to time. Something most programmable calculators of the last decade could do.

Even the 5 computers running the shuttle have less computing power than your average 286. I don't know what they're using now, but ISTR that the original computers (which were designed in the late '70s) were actually 4-bit machines as they couldn't find any 8-bit processors which could stand up to the radiation etc.

TTFN - Pete.

```
It is only 64K. total ram may be 80K but only 64k is ever seen. the
"missing" 16K is dissabled in hardware. Works like this.
0k <-> 16k. use internal ram in the 600xl.
16k -> use the external ram from 16k <-> 64k.
The first 16k in external ram is not used and there is no provision to
use it in any way what so ever.

I would use SIO directly rather then the resident disk handler. Not much more work, like about 5 bytes worth in the DCB. That way, you can use 256 byte sectors. If you where really ambitious, you could set up 512 or 1024 byte sectors all the way up to 64K sectors. of course that would require a some custom hardware/software to handle it. 64k sectors wouldn't be possiable unless a custom sio routine is written to buffer that amount into extra ram.

Not to pick a nit here but I read once somewhere that the computing
power that we used for the moon project was about equivilent to a
single average 486 class PC. That of course is substantially more
powerful than 2 C64s. It would also seem to be more likely since NASA
used state of the art for the moon project and we landed on the moon
in '69. The 65xx chip is basically 1970s technology.

Just what you need to relive the days of your youth or teach your kids how to take the most advantage of a capitalist economy.

Seriously though, this is one of the greatest games I've ever played... I guess playing games against family and friends (or enemies) is just more fun to me than trying to beat my record of 1,000,000 on Defender (although I do try this at times too.)

As far as I know, the Atari 800 is the only stock computer of any platform in existence that you can play M.U.L.E. with 4 human players. (Note: you could also play with 4 human players on an upgraded Atari 400 w/48k, but as far as I know thats all).

If you are interested in purchasing such an Atari 800, I do have an extra one that I'm parting with (along with a M.U.L.E. disk) on ebay and you can check out the details here:

>disk image ?
The maximum size of an 8-bit Atari disk is 16 MB (256 bytes times 65536
sectors). I'm not sure about disk images, but I've used an actual disk
of that size (MIO + 20 meg hard drive, partitioned 16 meg + 4 meg). I
think, to accurately emulate most real disk drives, an emulator would use
256 byte sectors for images larger than 140K (the size of a 1050 enhanced
density disk).

Source record: 47141

Hi Dan-
In my setup, I use a 210 MB Conner SCSI (I)
drive along with an Internal Zip SCSI drive.
These are inside a PC "Shoebox" case.
I assembled this about two years ago, maybe 3, so all the details aren't fresh
in mind. But,
my recollection is that since the first and last
device on the chain must be termininated,
I left the termination on both. It has always
worked *perfectly* -- never missed a beat,
never had a bad sector, etc.

Now, for the external SCSI. I have one, but
have only used it with my PC. SCSI 50 (2X25)
to DB25 adapters are common, and you also
probably could make your own. These are
typically set up on a PC card slot bracket,
although I have seen them without at Computer fests. Nice thing about the
external is that you could unplug it and use it
with a PC as well as the A8. Iomega's web
site has a TON of info, including manuals,
etc. http://www.iomega.com/
On the back of the ZIP is the ID and
termination on/off. I am not aware of any
differences in setup between the inside and outside ZIP SCSI drives. If power
was
required, wouldn't the drive furnish it?
You also might want to check out
http://www.jameco.com/ for adapters, etc.
--one of my favorite places/catalogs. A fair
amount of discussion has taken place about
ZIP drives, so you might also want to check
out the dejanews archives
http://www.deja.com/home_ps.shtml
This should be the "Power Search" page.
One thing that has been mentioned before,
but bears repeating. Nearly all modern
3-1/2" SCSI drives require parity. A stock
Black Box requires the addition of the parity
chip. If one uses a Floppy Board, the chip
must be mounted on the *bottom* of the BB
board, and there may be very little to solder to, so I left it to CSS to solder
it on. The
chip was about $15, including installation, but

the drives will not work without it, unless
one has a very rare drive that doesn't use parity, or allows it to be selected
with jumpers.
Hope this helps.
Larry

738. Tandon in a RANA?

Newsgroup: comp.sys.atari.8bit
Date: 2000-01-23 00:00:00 UTC
From: llpwhite@cs.com
Message-ID: <20000123085643.02716.00001827@ng-fz1.news.cs.com>
Source record: 47142

An article was written a long time ago about
putting a 1050 Tandon mechanism in an Indus GT drive.
It was pretty straight-forward once you figured out
the correspondence of the wires. Has anyone ever
done the same with a RANA? I have always hated the
"pull-down" clamping/closing mechanism that RANA used.
Seems like it would make a nice hack.

>- What format are these in if any (Are they just a linear sequence of bytes
>equal to the number of sectors*128 ?)

Yes for XFD, MyDOS will even access DD with # sectors*256; just leave bottom half of 'sectors' 1-2-3 as zeroes. ATR is the same except for 16 byte header; read it once but no longer remember that header configuration. Have never generated MyDOS or Sparta mega-image with VTOC, etc...? Yogi has some 1MB ATR's (approx 8000 128 byte sectors) which I use; just make a copy, delete the files and add mine. Good luck

Hi,

Thanks for the fast and informative replies.
Your suggestions are much appreciated.

Peter

744. Re: In support of linear, fully addressble memory

Newsgroup: comp.sys.atari.8bit
Date: 2000-01-24 00:00:00 UTC
From: tnewton856@aol.com
Message-ID: <20000124025813.03698.00001828@ng-fv1.aol.com>
Source record: 47005

The 6502 CPU in the 8-bit Ataris had a fairly linear addressing model (once you discount the special treatment given to the first 256-byte "page").

It was the system design that created the bank switching problem (i.e. Atari placed more than 64K total RAM + ROM + I/O space in there). As I recall, the first Ataris (400/800) didn't do much in the way of bank-switching.

By contrast, the 8088/8086 were plagued with a non-linear model from the start: memory had to be accessed in terms of 16-bit (0-64K) offsets from an address defined by a segment register. Flat addressing was only added later, with the 286 and 386.

I have here the source code of two different Pokey emulators

- the well-known Ron Fries emulator

- the Pokey emulator part of the SAP player (see ASMA homepage http://mp3.musichall.cz/Unreal/ASMA/)

Does anyone know how they compare ? Which has the better sampling quality ? Most compatible ?

I have a limited amount of brand new Atari Jaguar items for sale or trade. These packages are ideal for new collector's or somebody wanting to start or add to their Atari collection. If you have any questions, please feel free to ask. I am also willing to trade for certain items, please see my list at the end of this post. All prices quoted are in U.S. funds with the buyer paying shipping.

If you are interested in any of these items, please respond to Jim at classic.games@NOSPAM.telusplanet.net?subject=Classic Games (removing the NOSPAM first). Or email
me if you would like a current listing of items I have for other systems (Atari 2600/5200/7800, Colecovision, Intellivision, Classic Computer, Vectrex or Handheld games) sent to you, please specify system.

** Atari Jaguar Packages - Brand New (all contain one controller, RF Box and AC adapter)**
==========
Box conditions vary, best condition boxes will be sold first.
-.Atari Jaguar with CyberMorph cartridge and Composite Video Cable $50
- Atari Jaguar with CyberMorph cartridge $40
- Atari Jaguar (No Cart) $30

** Atari Jaguar Games And Accessories - New/Shrink-wrapped**
==========
- Checkered Flag $10
- Composite Video Cable $15

Atari Force Comics Please make an offer
==========
All are in Mint Condition
- Issue #2 - February 84
- Issue #3 - March 84
- Issue #11 - November 84

Trades
==========
I am also willing to trade for rare or shrink-wrapped/sealed titles for...
- Intellivision, Colecovision, Vectrex or various Atari systems
- Shrink-wrapped Intellivision NHL Hockey or PGA Golf
- Shrink-wrapped or mint SEARS Telegames for the Intellivision
- Shrink-wrapped or mint DigiPlay games for the Intellivision
- Shrink-wrapped or mint Intellivision Tutankhman, Super Cobra or Popeye
- Intellivision Congo Bongo, Draughts, Triple Challenge and Fathom
- Rarer Mattel and Coleco Handhelds (a list is available upon request).

- A complete brown variation of the Intellivision ECS
- A World Book Tutorvision (Intellivision III Clone)
- A complete Atari Jaguar and Jaguar CD Unit
- A working Vectrex controller
- A working DSS Satellite Receiver with H Card
- Working DSS H, HU or J Cards
- And of course the ever popular, original Intellivision keyboard (should I be so lucky :).

Just a quick msg to those who know me in here :-

At 2.00pm on Saturday my wife and I rushed to the maternity hospital, by 9.37pm on Sunday after quite a few complications and a cesarian(sp) my lovely wife Cindy gave birth to the most beautiful baby girl weighing 7lb 14oz.

To anyone doubting the joys of child birth especially being there through everything I have to say its amazing beyond words :)

Have fun people :)

I'm a bit confused. You have a couple of "New" Jaguars for sale, but
also willing to trade for a "New" Jaguar. What is wrong with the ones
you have? The CD is a seperate unit, why not keep one of your new ones
and just look for a CD?
Intellivision keyboard? There is one at the local thrift store, but it
surely isn't shrink wrapped. I don't even think they do that at the
counter. ;')

> out after that, as he wasn't interested in a 100% computer magazine.
>
Actually, I'm not mistaken. Creative Computing and Elementary Electronics
were two completely different magazines.

I've already said that Creative Computing started in 1974. I have in
front of me EE for Jan-Feb 1975, and also the Jan-Feb 1976. How could it
eveolve into a magazine that was already being published?

The May-June of 1981 issue, which happens to be the latest issue I have,
is actually titled "Sicence & Electronics" but it's nevertheless Elementary
Electronics with basically the same people on the masthead, and the
same features. It does say on the cover "including Computers & Programming"
and there is a fairly large computer section inside. I can't remember
if "Computers & Programming" was once a standalone magazine, spun off
from Elementary Electronics and then folded back into the magazine. The
"science" in the title seems false, at least in this issue, because
the section of the index entitled "science" has three articles listed,
all electronic related.

The little blurb in fine print on the index page says "Science &
Electronics/Computers & Programming including Elementary Electronics".

On page 49, there is a full page ad for Creative Computing.

So either you remember EE when it changed into a computer magazine,
and I don't remember it becoming as much a computer magazine as Popular
Electronics did when it changed it's name to Computers and Electronics (or
something like that), though I admit I asn't paying much attention
to the magazine at that point, though I did start reading EE at the
beginning of 1971.

Or when the smaller magazines were being bought up shortly after that
1981 issue, Ziff-Davis which did eventually buy up Creative Computing
and a lot of other magazines, might have also bought up "Science & Electronics"
and then shut it down, as it did to quite a few magazines in that period.
Subscribers might have then ended up with Creative Computing, which was

probably in better shape than some of the magazines. That's hardly morphing, it is just giving you one magazine instead of the one you originally subscribed to.

And of course, Creative Computing didn't last all that long after being bought up by ZIff-Davis.

Eventually, "Hands-On Electronics" started up towards the end of the eighties. A number of the people connected with that magazine were connected with Elementary Electronics.

And of course, with time, "Hands-On" was bought by Gernsback, or was Gernsback the publisher from the beginning? And then, "Hands-On" was renamed "Popular ELectronics" because Gernsback had somehow got the rights to the name.

And then at the end of 1999, Popular Electronics died fro the second time. It was combined with Electronics Now (which used to be Radio Electronics) and the combined magazine is titled Poptronics.

I don't think you can go back. At the end of the game you'd just get
an account number with which you can start a new game with more money.

Try "TRON" as an account and "999" (or "9999") as the account number...

The shuttles just got a computer upgrade. They're now running 486's! No bull!

But,
We need to remember that it takes years to validate a CPU for space use. Chip
take alot of abuse up there.

Yes, there are about 20 Atari 8 Bitters (or more) around Stuttgart.
Just mail to Marek Tomczyk or take a look at his fabulous link homepage
at http://www.uni-karlsruhe.de/~Marek.Tomczyk/8bit.html
There is also an active regional group of ABBUC members around
Stuttgart, called ARGS... You just missed their last meeting (15.1.
2000). greetings - Andreas Magenheimer

P.S.: You will also find some links at the ABBUC homepage,
that show pictures of the ARGS members and their adresses...

We went around and around on this in alt.folklore.computers. Richard Feyman, Nobel Prize winner, had a really interestting perspective on why the shuttle program is the way it is. Really good read, can't remember which of his book it was in, probably the same one that had "Cargo Cult Science" as one of its chapters.

But basically the amount of radiation the shuttle catches is not that much. Its orbit is way below the Van Allen radiation belt and the amount of radiation that would have to be present to be a problem with even a lightly shielded computer would be enough to kill all the astronauts.

From what I understand, a lot of the astronauts just grab their personal laptop for use in space and haven't had any problems.

I have some 8-bit stuff that really needs to go. I don't have much space to store this bulky stuff for any legnth of time. I picked this stuff up as trade bait and haven't tested it. I mainly collect Atari 2600 and NES. Feel free to email if interested in anything.

Atari 800 w/AC Adapter, Basic cart (boxed)
1050 disk drive w/amazing Dos 3.0(boxed)
410 tape drive
1025 printer
Xetec Graphix AT adapter

Tapes:
Biorhythm, States and Capitals, Energy Czar, and Pacific Coast HWY

This is the first batch, I have another batch yet to be unearthed....Let me know if you some or all of it.

Chris

Hi Robert,

Atariwriter saves its files as straight ascii text, you could use a null-modem cable and connect your PC and Atari (through an 850 interface) and simply file transfer them over to your PC, if you'd like to get a little more fancy you could buy or build an SIO2PC (Jason Worley here on the newsgroup makes great SIO2PC interfaces) and you can download the software and connect your Atari to your PC and use your PC's disk drives and HD as storage and simply save all your files to your PC, then run WP and open an ASCII text file and there you go.

Hi Erik,

No unless your handy with a soldering iron. You'll need to build a
scan converter (uisng a chip such as a Motorola TDA3330, Phillips makes
a better chip with a built-in burst gate circuit which can save you a
lot of time and aggrevation) you'll lose colors but you can do it.

I once wrote a column on this very subject. (Carolyn's Corner, March 1991). It was about converting files created with AtariWriter Plus to PC text format. Since I followed my own advice, I have this column in PC format and can e-mail it to you in either MS Word format or plain text.

Of course, this was written before the Internet, emulators, or utilities that let you read double-density Atari disks directly with a PC, so the task is somewhat easier now.

Let me know if you would like to have this column.

Carolyn

>
>Anything to help me on the track to get it up again would be greatly
>appreciated.

Yes, get rid of those damned Kyocera drives! The first (possible) problem is
the KC30 is an RLL drive. The second (more likely) problem is the Kyocera
drives are just plain junk. My first setup was with a KC30 and the drive had a
nasty habit of writing bad sectors. What would happen was the heads would
still be bouncing after a seek to a new cylinder and try to write the data
before the head stabilized. At first I thought it was just a defective drive
but after exchanging it for another KC30 that did the exact same thing I took
it back and bought a Seagate.

I hate to say it, but as far as I'm concerned Kyocera is just another Japanese
word for DOORSTOP.

I'm sure you got those drives for virtually a song, but I hope it wasn't more
than half a verse of "Row Row Row Your Boat"...

Hopefully you can still find an old Seagate, Miniscribe, or Conner MFM drive...

787. FT Atari 8-bit equipment -- A Clarification

Newsgroup: comp.sys.atari.8bit
Date: 2000-01-26 00:00:00 UTC
From: Chris Ross <pragmatist@kc.rr.com>
Message-ID: <388E75BF.1769B956@kc.rr.com>
Source record: 46948

Here is a complete run down of what I have discovered about these items. It pays to take careful notice.

The disk drive comes in full styrofoam and box. The drive looks very nice as

does the AC adapter. The box has a ripped flap that extends into the body of

the box as though someone tried to force the not fully closed styrofoam shell
into the box. It also has that brown packing tape in various places on the box, and some of the color has come off the box where this tape has been removed.

****
With the computer itself, I realized with a closer look that the 800 is not boxed. It was sitting in "The Educator" kit box, which apparantly is for the

program recorder, the basic cart, and the States and Capitals cassette. Sorry
for the misleading info on that part. Obviously no styrofoam for the computer,
and the box has that same packing tape on it as well as some crushing on the

top part of the box.
****

Curt,

AtariWriter and AtariWriter Plus do not use "straight ASCII text." The text is in ATASCII, which is slightly different. Mainly, every line end will have to be changed from ASCII 155 to ASCII 13,10. And there are also formatting codes included in each Atari file which will not translate correctly. There are utilities available nowadays that will do these changes automatically.

I describe an alternative method in one of my old "Carolyn's Corner" columns, which were written in the early 90's for the Mid-Florida Atari Computer Club. They were also made available on CompuServe. I've offered to e-mail the appropriate column to Robert.

Once you have the "zillion" files transferred to your PC, there are
numerous utilities that can convert the files to "Straight ASCII". If you
can't find one, ask around on this NG.

791. Another 1200XL green screen

Newsgroup: comp.sys.atari.8bit
Date: 2000-01-26 00:00:00 UTC
From: Stinky <octopus@aracnet.com>
Message-ID: <388EB764.39F63D2C@aracnet.com>
Source record: 46952

Hello everybody,

I have a 1200XL with the dreaded green screen of death on power-up. I'd like to start swapping chips but I don't have another 1200, just a bunch of socketed 800XLs for spares. What chips are interchangeable between the two? Particularly, is the PIA interchangable---if so, can anybody tell me where on the two boards (1200XL and 800XL) the PIA is, since somebody in another thread said that was often the cause of the green screen?

Thanks for any advice!

Thanks Len. I got them for only the first word in Row ... :-) I took them home from work after we started using IDE instead. I do have a Rodime R0652 and a ST225. Might be some others too, but I suspect they are ST225's also. Are the setup for these ST225 drives correct if I use
CYL : 615
HEADS : 4
Sectors : 81179

Thanks again. I thought the KC drives were pretty good, they lasted many years in the video stores we used them in. But, of course old age can kill a drive.

Take care

IIRC the 6821 or MC6821 is the same chip, but often cheaper.
But make sure you get the right version.

I believe the 6520 is 1MHz and the 6520A is 2MHz, while the 6821A is 1MHz and
the 6821B is 2MHz.

Gene didn't rip anybody off ever. I mailed a refund to the man over a week ago. I even sent him back the cost of his money order. He owes me a public apology.

Following is the e-mail I sent to him.

To: Mathematatin@webtv.net (Thomas Bafia)
Subject: Re: Atari 8 Bit
Cc:

At 08:14 PM 1/5/00 -0500, you wrote:
Dear Gene,

I'm the person who ordered the DOS Master Diskette 3 for the Atari 8 bit
---

I just found the disk but it was warped and not usable. I am mailing (tomorrow) a refund of $8 to also cover your cost for the money order. Sorry for all the problems. I usually ship right away but the trip came up so suddenly that I did not have a chance to finish getting shipments out. Came back to over 1900 messages.

No he doesn't. At the time he posted his problem, he hadn't heard from you
despite numerous emails. He wasn't to know you were away on a trip so his
comments were perfectly valid. i'm sure you'd think the same in his
situation. The fact that you've now returned from your trip, cleared up
the mess more than admirably does not invalidate his original message.

It's just one of those things. He didn't know what you were doing and you
couldn't tell people. Such is life. No-one owes anyone apolgies. It's all
sorted now so let it drop.

At best he ought to post a msg confirming receipt of his refund and that
he is now happy.

Mr. Bafia owes me an apology for the premature badmouthing he did towards me. He accused me of ripping him off which is not true. I mailed him a refund, not just for what he sent to me but also included extra to pay him for both the money order and postage he spent.

I came back to over 1900 messages. Saw his when I got back and responded immediately explaining to him that I been called away for two weeks on an emergency and had not had time to complete my orders and I would get back to him the next day after reviewing my messages. That was two weeks after I received his payment not a month. I got the disk out for shipment and found that it was warped and unusable. A refund was in order. I sent a message that I was mailing the refund which I did.

He was not ripped off. Anybody who has dealt with me over the years knows that. At times there are circumstances that cause some problems as with any type of communications. Correcting those problems as soon as possible is the true test test of an honest man. Bad mouthing others is not. An apology from Mr Bafia to myself is in order.

Cylinder and head numbers are correct, but total sectors should be 78720. On these drives the 4000a will format to 32 sectors per track at 256 bytes per sector. Of course that is before mapping out the bad sectors, which the Adaptec cards handle very well.

Hope this helps.

All the chips except the OS ROMs and MMU are interchangable, but I really
don't think it is your 6520. A 1200xl will even boot if you *pull* the 6520,
you just won't have joysticks and some SIO functions.

If it was me, first thing I would do is just leave the computer on with the
green screen for 5-6 hours, then try to reboot. I kind of speculate that
oxidation/moisture of the disimilar metals causes some galvonic<sp?> type
cells at the contacts that keep them from running until they get warm and
dry out a bit.

I would also guess that it isn't your GTIA since the presence of the green
screen probably means most of it is working.

If the burn in doesn't work, next thing to try would be replacing the ram
chips. They are pretty much just standard 64k x 1 drams and if you can't
find those 256k x 1 will work but only give you 64k of memory.

I want to transfer files from either my PC or MAC to my 8-bit. I have an 850 interface and was wondering if a standard null modem cable from Radio Shack will work with the 850. I realize the Mac will require a different cable then the PC.

Pete

Same thing happened to me. I made both versions of the cable listed on
the site, and neither worked. And I also triple checked everything with a
meter, and tried several 8-bit drives that I know work. And this was with
a working and tested Atari 520 STE.

If you get an answer, let me know too! 8*)

A few months ago, local Radio Shack stores (in Southern California) were
selling 10-pack DS/DD floppies for $1.97 per box (clearing them out). I
visited several stores and picked up about 20 boxes total.

Dan,
I am also looking for a 14C89 CMOS Quad Line Receiver, required for the ProSystem Interface. Radio Shack only has the 1489 Quad Line Receiver. Is this the same thing?

I too have built this cable for my Atari and PC. I have yet to get it working. If anyone gets any more information can you please pass it on to all. I tried it on my TT,ST and PC but nothing. What a disappointment.

Does anyone know if a 5.25" Atari ST drive can read Atari 8 bit disks? I have purchased the drive but, it has not arrived for me to try out. If anyone has done this or knows if it can be done please let me know.

Thanks Don

No. Some of the pins at the 850 end are not the same as a "standard"
cable. The pin-outs for the 850 are (I believe) in the 8-bit FAQ and are
the same as the scheme used by the P:R: Connector and MIO.

With the PC, you'd get far better and faster transfers using SIO2PC or
APE and the cable's quite simple to build.

You can plug in a 512K SRAM into the Basic socket (or one of the OS sockets
in a 1200XL) with minimal wiring - requires a little daughterboard actually.
Works real good and can be data retained with a lithium cell.

run the CPU (use a 65816) at 7.16 mhz for each cycle that either uses no buss addressing or SRAM memory (which will easily run at 7+ mhz). All other access (OS ROMS, POKEY, ANTIC, etc.) runs at 1.79 mhz just like a normal Atari. Probably be best to use a hardware toggle to enable the fast-burst-ram mode so we don't screw up Pole Position and stuff. You would want to pull your OS into SRAM for really good performance, but we already have that, don't we???

That should be #2 block (16k-32k); otherwise you'd be banking out the
cartridge area and, more importantly, the display area (usually).

Click for WebSite!

I've added more and will be adding more Hardware, Software, Books and
Accessories for Classic 8 Bit and Atari ST. So checkout what's new on
my WebSite. In Fact, check it regularly as my Catalogs are updated
regularly. Customer's are served, first come, first serve! I have 6
different Catalogs, and my SoftWare Catalogs are my largest. They have
the biggest Byte Count. You should see my inventory! I have TruckLoads
of HardWare, Boxes & Boxes of Software & Libraries of Books & Reference
Material for the Classic Atari 8 Bit & Atari ST! And remember, if you
can't come see me today, come see me tomorrow!

also, if you live in Portland, Oregon, interested in Atari and want to
meet with other Atarians. Read the Ad near the bottom of this message.

FREE Catalogs for Classic Atari 8 Bit & Atari ST Computers! Hard-
Ware, SoftWare, Books & Accessories! View Atari Catalogs on the Web at
http://www.atari.benjamin.net And Jump to my FTP site linked to my Web
Site so you can Download Free Catalogs or FTP directly to my site at:
ftp.teleport.com/vendors/bensmith/ If you can't get Catalogs that way,
Feel free to Request catalogs through E-Mail. Really, it's not an
inconvenience. I do ask that you specify Atari 8 Bit, Atari ST or Both!
Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail.
Please let me know if I can attach text files to your E-Mail. Catalogs
are just regular ASCII text files so you can download them into your
text editor and view them, edit them or print them out! It would make
things easier for me if you take my Catalogs, load them into your text
editor, delete what you don't want and E-Mail me the rest! To expedite
things, include your complete Mailing address so I can figure your
Shipping/Postage & Handling. I'll be back after the weekend.

If you have an Atari and live in Portland, Oregon. U.S.A. or vicinity,
you are cordially invited to attend a Meeting of the Portland Atari
Club. You don't have to be a member to attend. Now we've moved our
meeting to a new night. Same Bat Time! Same Bat Channel! We meet the
2nd Thursday of each Month. Our Next meeting will be Thursday, February
10th, 7 pm at the Pizza Baron at 2604 S.E 122nd Avenue in Portland,
Oregon. We're trying to rebuild our club so we're looking for Atarians

who wan't to get involved in supporting other Atarians. If your interested, call Ben at (503)256-9974 and by all means, come to our meetings on the 2nd Thursday of the Month. For more info, surf the Web@

http://pac.pdxweb.net

e-mail: atari@benjamin.net

For more information or directions, please call our Vice President Ben Smith at (503)256-9974 See you there!

You should know I regularly add more Atari stock items to my catalogs and this weekend is no exception. A list of my new ST Software I just added to my Catalog are listed below. In case your wondering why my Catalogs (below) are formatted to 38 Columns. They are made to be compatible with the lowest common denominator. Also known as the Atari 8 Bit. Once the Classic Atari User converts the Carriage Returns to Atari 8 Bit.

You can wire a 1 MEG SIMM straight into an 800XL and it will work great but all you get is 64K. You need the extra chips for creating the "window" into which the other "banks" are switched into. Also the extra chips are used to create the "banks". Add 130XE mode with ANTIC able to use the extra memory separate from the main memory and you need more gates and logic chips. Hope this helps.

>>Does anyone still manufacture 5.25's? I noticed that MEI has not listed
>>them for some time.

Several sources have been mentioned, but
the source with the best selection is that I
have found is Media Source: http://www.mediasourceinc.com/
They carry 4 or 5 different brands as well
as bulk 5-1/4", but they run from *around*
$.25 for bulk to up to $4.50/box of 10. Last
time I purchased some of their bulk disks,
they did not have center hub reinforcements.
If you have a drive that does not spin-up
as you clamp the disks, this can be a problem.
Larry

Welcome to comp.sys.atari.8bit, the Usenet newsgroup for discussion about the Atari 8-bit family of computers! These include the 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, 800XE, and the XE Game System.

Many topics are covered over and over again. To help alleviate this trend, several people volunteer their time and energies by maintaining Periodic Informational Postings for this newsgroup. Please take a moment to refer to these documents before posting to comp.sys.atari.8bit. The answer to your question may already be readily available!

Users of comp.sys.atari.8bit actively maintain the following Periodic Informational Postings:

You need an Atari modem cable, PC or Mac serial/modem cable and a null modem adapter (standard PC type 25-25pin version). It works great. Don't forget that you will also need compatible terminal programs on both machines to x-fer files (x-modem, x-modem 1k, Y-modem).
As mentioned in another post, SIO2PC/Atari Peripheral Emulator and the SIO2PC cable will do a much better and faster job. This system will allow you to use .ATR disk images directly with you 8-bit computer, convert/transfer file in both directions.

All,
I built it and it worked fine (after a few retries). Just remember it
is a read only cable. You can't write back to the floppy.

I've come across a box of 12 Quantum 105S scsi hard drives. These drives work great on the BlackBox for the Atari 8bit.

If you'd like to trade/buy one/some, contact me.

I understand that. But I'm wondering generically, if I had an Atari & a free 8 bit port on a PIA AND I wasn't worried about being 130XE compatable, how do you do it?

I'm wondering if A0-A7 give you 64K, then using A8-A10 give you 7 more 64K banks, and then using CAS or RAS give you 8 more.....I read an old post between 2 people about using 1 Meg SIMMs and they suggested that they had A0-A9 plus CAS gave them 2^20 or 1 meg of addressing....

How does this work?

Was that a 1050-2-PC or XFormer which functioned properly?

The reason I attempted the XFormer cable was my belief that it went both ways
(read, write) to the floppy drive.

Not quite if you power it off the PC serial port. 14C89 works in both SIO2PC
and Pro cables, but will not work without the aux wall wart like he
describes on his page. Radio Shack only carries the stock 1489 version vs
the 14C89.

Here is a email that I got from emulators.com

And, yes, it does work bi-directional (both ways - ahhh, ughhh, cool!).
I am using it on a crappy ass 386 laptop and it works great!

Subject: RE: xformer cable
Date: Mon, 24 Jan 2000 20:26:23 -0800
From: Darek Mihocka <darekm@emulators.com>
To: Stormbringer <billo@corecomm.net>

The Xformer cable was designed to be used with Atari ST and MS-DOS
computers. Thus you use either the ST Xformer software for GEM or the
PC
Xformer software for DOS. The current version of Xformer works on
machines
till about 150 MHz, it may have timing problems on machines faster.
Remember
that the cable was first developed and released in 1988 so obviously
12
years ago it and the software could not be tested on today's 800 MHz
PCs.
You may have problems using the cable on a fast PC, that is long
known
problem.

Source record: 46990

I've given up on making the Xformer cable work with my 500mhz laptop. So I've disassembled it and converted it to a ProSystem serial cable to be used with the ProSystem software. Guess what? This one doesn't work either! Maybe because the required 14C89 CMOS was nowhere to be found, and I had to substitute a 1489 chip??? Help!!

Carolyn

Hi,

This is my first massage to atari 8bit group. In the 80s I didn't have any Atari machine (money, money, ...), but I am still very in 8bit machines. However, I have Xformer7 emulator from emulators.com website. It looks like fine emulator, but I can't start any program on it. I have couple of game roms (with extension .atr). I found also that I need some other files to run this emulator correctly, but in my version of Xformer7 is only Xformer7.exe (when I unzipped the xf2000 file). Sorry for such beginners question, but If somebody can help me and post answer on this newsgroup or to e-mail address lomen@eunet.yu

Thanks for any help.

Ivan

> How does this work?

Very short and simplified description: (and note it's been quite some time
since I've dealt with this)

There is 64k on a stock 800xl. Think of this as four different 16k blocks:
#1 - from 0k-16k; #2 - 16k to 32k; #3 - 32k to 48k; and #4 - 48k to 64k.

Memory upgrades work like this: One bit on the PIA is used to indicate that
expanded memory is to be accessed. Expanded memory is swapped in to replace
the #3 - 32k to 48k memory block on your computer.

The logic is like this:

IF PIA select bit is true AND A15 is true and A14 is false THEN use the
expanded memory.

Other PIA bits indicate which 16k block in expanded memory is to be used.
So, one more PIA bit gives access to 2 banks (0 or 1), or 32k. Two gives 4
banks (64k more). Three give 8 banks (128k); Four give 16 banks (256K);
five give 32 banks (512K) and six give 64 banks (1024K).

The 130xe mode uses four bits: one to indicate CPU access to expanded
memory; one to indicate ANTIC access to expanded memory, and two to indicate
which bank of expanded memory is to be used. Note that this means that
ANTIC and the CPU can use different areas of memory (one main, the other
expanded). It also means that if both are accessing expanded memory, they
must access the same bank.

Clear as mud now?

David P.

> required 14C89 CMOS was nowhere to be found, and I had to substitute a 1489
> chip??? Help!!

Disconnect the zenier diode and place 5v across pins 7
(ground) and 14. Your serial port probably does not have enough power
to drive the non-cmos version of the 1489. A discarded wall-wart
is a good way to get the 5v+.

The 14c89 can pe purchased at any online IC distributor for
about 20 cents more than the non-cmos version. Try www.jdr.com or
www.jameco.com. One of these has no minimum order, I believe JDR.

Good luck!

Steve

That doesn't make sence. may be the software is read only. If the
cable works with the 1050, it must be able to write to the 1050 to
tell it what to do.

I just bought a new 68cm tv today. It can handle several different tv standards. Figured I would try the 1200xl I have but couldn't use because everything is PAL here (australia). Works well after getting half of the keys on the keyboard working again. It is amazing to see how different games are, some play a bit faster, but all music/sound effects are faster. sounds strange. need to get used to that.
I wounder if the tv supports artifacting? must give it a try sometime. just may see colours where prevously i would see shades of grey, ugly liney stuff at that.

>since the Atari basically shares the bus with the peripheral chips? either
>they have the bus, or the CPU does.

Well, either CPU or ANTIC control the bus. None of the others are ever "in
command". The CPU controlles just about everything, ANTIC only speaks to RAM
via the bus.

Howdy folks

>make sure that your power supply is good also,thanks,

Yes, try another power supply first.

I found out just in time that my power supply was losing it back when I had a green screen. It would sometimes jump from green to blue and back and even flash (white) sometimes. The green was "spinage" (don't know about the spelling, it's the stuff Popeye eats) green and the text was still visible.

Green meant low power, the flashes meant to much power. I measured 11 Volts once.

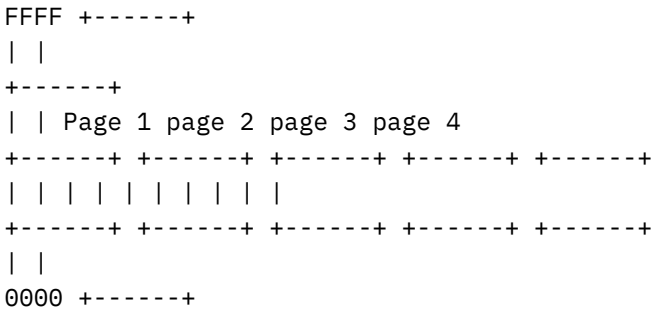
> between 2 people about using 1 Meg SIMMs and they suggested that they had
> A0-A9 plus CAS gave them 2^20 or 1 meg of addressing....
>
> How does this work?

A quick explanation of how SIMM memory work. The adress bus is
multiplexed.
What you do is first put the low part of the adress to the A0-A9 inputs.
Then pull RAS low. Next input the high part of the adress to A0-A9. The
pull CAS low and you read or write the byte that you adressed.

Then the next question is how to generate 20 adress bits out of a
processor with only 16 adress bits. The solution is what people refer to
as banking where some part of the 64 K have multiple pages that you can
adress. Usually by changing the port B bits of the pia chip. If you look
at the memory map it looks something like this:



Now depending on the output bits from the Pia you'll get page 1 to page
4 in the adressing space 4000 to 7FFF.

Sincerely
Olav

Source record: 46911

You need to understand one thing, it takes 16 address lines to access 65535 bytes of memory (64k). Address lines A0-A7 select which byte in a "256byte block" and A8-A15 select which block of 256 bytes out of 256 blocks. 256 x 256 = 65535. Think of memory addressing in "blocks", it's easier that way. Now when we add another address line, say A16, that will select two 64k blocks (A16=1 & A16=0) for 128k of directly addressable RAM. But the Atari has a 6502 which only has 16 address lines. That's why the bits of a PIA chip are used to control Banking circuitry. Even if you could devise a way to add address lines to the 6502, first off you're redesigning the basic CPU, it can be done with a mass of external chips but it's really mute since there would be no software to make use of it and no real advantage at this point in time. It does not matter what is done with the address bit, the internal structure of the CPU registers can only use 16bits of the address system. A 6502 will never know it has any more than 64k connected to it. Sure you can "fool" it by switching in 64k banks but that gets real complicated since the 6502 uses 0 page addressing unlike the Z80 where I have switched in a whole other 64k on it and it kept on going.

Does this help?

Two different ATARI 1040 STf computers, up for bids on ebay through
Sunday Night 1/30/00.

They both power up and the floppy drive spins, but are untested
further.

The first one is in good shape despite some yellowing, see a photo and
description at:

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=248001177

The other is also nice but missing four keys, see a photo and
description at:

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=248000462

Both bids start at $5.00

Also see lots of other stuff up for bids while you are there.
http://cgi6.ebay.com/aw-cgi/eBayISAPI.dll?ViewListedItems&userid=cosmictoys

Thanks for looking!

Gang -

Have used the Atari Peripheral Emu (registered) and love it. I'm
trying to get it to run on
Linux now (preferred enviro) RHAT6.0, have followed closely the
instructions on
the users guide at http://www.nacs.net/~classics/ape/ape.htm and it,
will, sort of,
work; it will slowly read a few sectors of mydos4.53 and then hang -
I've
- changed the #RX_READ_FREQ and #MS_MIN_FREQ to 19L and recompiled
and copied dos to /usr/bin/dos - setup only one port in /etc/dosemu.conf
-
I have no idea where to find "sillyint" ??? I've bailed out of xwin and
just run a
terminal, tried renice'ing to from 14 to -20, tried setserial spd_vhi -
always w/
the same slow results. This is on a 200Mhz PPro. Could the prob be the
"FreeDOS"
that comes w/ dosemu-0.99.10-4 and it will only work on genuine MSDOS??

TIA

Chuck

863. Hackerbook and Joystick For Sale

Newsgroup: comp.sys.atari.8bit
Date: 2000-01-29 00:00:00 UTC
From: ronwizbot@juno.com
Message-ID: <38935dcf.1073955@news.erols.com>
Source record: 46924

Hello,

I was checking through some old boxes and I discovered two items left over from when I owned an Atari 130XE. One is a nealrly new condition Radio Shack joystick, with autofire. I remember buying it for $14.99 but I'll let it go for $4.99 plus shipping USPS.

I also discovered a 1983 mint condition "Hackerbook for your Atari Computer" by H.C. Wagner that was written for the Atari 400/800 and mentions how to make a bootable cartridge and how to create an Atari Eprom burner from game ports 1, 2, and 3. It also mentions how to create a serial port or a parallel port from game ports 3 and 4. It includes the source code listings in the text. I think it cost $7.95 new, so I'll let it go for $2.99 plush shipping USPS.

Let me know if you want one or both items.

Ron Powalisz

True. I found some on the Internet from a company called Firstsource.com. They were selling 10-pack Verbatim Datalife disks for around $2.95 per 10-pack. However, none of the disks had the center hub reinforcements, and the disks can indeed get a bit "chewed up" in certain drives if you're not careful.

And I found that only around half of the 5 1/4" disks I bought from Radio Shack had the reinforcements (the one's that were "Made in USA" did, the "Made in Mexico" didn't).

It would appear that the few manufacturers that still make them (generally only when they have a large enough order) don't bother with the extra expense of the center hub reinforcements.

I even recall one piece of software written for the ST that added an 8 bit
floppy to the ST's desktop with a whopping 88k of extra storage. But I guess
since the orignal STs came with 360k drives, adding an 810 for moving files
was no small improvement for some people.

I used them a lot back in the late '80s, no problem. In the advertising
they said you could remove the disk from the protective sleeve to clean
it! We were never brave enough to try it though.

876. How to get into the BIOS of Atari-PC3

Newsgroup: comp.sys.atari.8bit
Date: 2000-01-30 00:00:00 UTC
From: Maxxis <maxxis@gmx.net>
Message-ID: <872dgrhqe1@news05.btx.dtag.de>
Source record: 46936

Hello,

may you can help me...

i need to know how to get into the Award PC-BIOS 2.08 of the Atari-PC3, as i just kept this beautiful old work of art from being thrown away and now i figure it would be nice if i could get it back to work too.

actually, it worked for a short time... but after the batteries went dead it looks like it has lost the settings for the ST238R harddrive, so now it would only boot from floppydisk.

Another thing is, i got the following specs of the ST238R from the seagate web page:

615 Cyl, 4 Hds, 26 Sect, Prec. 65535, Land. 670

this should work in most pcs, however, i'm not quite sure, whether it would also work on the atari-pc3... any ideas?

I'd be very happy if anyone could help me with this.

Wishing everyone a great week,

maxxis

Sorry, but I have forgotten almost everything ST now. The only one I
remember for sure is the ST version of Xformer which worked with the Xformer
cable, but there were at least 2 other programs that worked either like
SIO2PC or ProSys cables. Maybe someone else can remember those programs???

Hi Maxis,

Upon boot up try CTRL + ALT + ESC of ENTER, that should get you into the BIOS menu and yes, those settings will be fine, its not a matter of those settings pertaining to the computer, but to the drive and regardless of whether is was places into an IBM, Compaq or Atari, if the BIOS is not Auto-setting (like later BIOS') then manually configuring the drive settings is the same on any IBM compatible computer. Have fun!

Curt

Nice site!.. the 400 you have pictured has a 'B-Key' 400 installed.made by In Home Software from Canada....(second edition.. the first had all brown keys before they came out with the white and gold keys!).. I'm quite certain it came out later than 1980..hmmm '82?.. I'll check as I have one along with the original docs.. matter of fact, I left work early that day to get mine! I ordered, and called daily.. with anticipation.. also, btw, the 800 came out the same time as the 400... I'm almost certain of that.. maybe both came out in.. hmmmm.. 78/79?? .. check Curtis Vendel's page for some pretty good history...www.atari-history.com! Oh.. the external looks like it's an 800 keyboard installed into a housing... never seen that before...then again, there's alot I haven't seen!
B'rgds,
Vinnie

Ronen,

Ive got the same external keyboard but, the maker is G R I and the label for the manufacture is a lot small than yours appears to be. My label is 3/4 x 1/4 its brown with 3 diamonds. Each diamond has a letter from the manafacture in it. On the back is a small stick that says SN 0340. The connector is a 25 pin connector made by TRW. The cable that goes with mine is a toss up since I have a bunch of cables with 25 pin connectors. I do how ever have a flat cable(blue) that has a 25 pin connector on it. I have never tried to use the keyboard. Does it use any software? And where does it plug into on the 400? If you wouldnt mind could you please post or pass along any information that you find on this keyboard.

Thanks Don

Man... I don't remember what I had for lunch yesterday.. let alone 20 years ago!!! I'll check thru all my old binders/mags... now I'm curious... but... my first guess is that 25 pin ribbon.. if it's` coming out of the keyboard, then, it most likely plugs into the 400... no software.. if u open up the 400, unplug the keyboard ribbon, that would do the trick! this would be my guess, not seeing it... I installed my B-key, which is the same type of keyboard I'm typing on right now on my toshiba laptop! In additon, I bought keycaps/swithches from InHome and buillt a matching numeric keypad which soldered into the 400! I did the same on my 800 using the Atari cx85, I hardwired that in too.. but it can be unplugged (I used a 15 pin (5200 joystick!) connector... the same one used on today's PC's!

Tonight I'll take a closer look at it and post my findings tomorrow, anyway
this is what remember regarding the keyboard:
The label is marked with "Sidewriter" lettering, there is a DB25 connector
at the back.
The opposite type of connector is mounted on the ATARI 400 that I have
(looks like a manual installation of it, also, that computer has been
upgraded to have 48K RAM memory). I've never tried to hook it up since I
don't have a flat cable (I should get one ant try...)

Hmmmm.. Sidewriter rings a bell!!!
there were a few guys that came out with various types if keyboards.. a couple were attached, as the one you have, as an add on... I remember one that attached on top of the 400... imagine this huge thing on top of where the membrame is... the bkey, I think, was the best... it was a direct replacement.. and really...not that bad... comparted to what it replaced.. it's not an 800/1200 but, hey, again.. not bad... the same as this laptop I'm using.. 20 years later... !

Can anyone here help with a non Atari, electronics project??? I have 2 stereo 'line audio' sources but my tv only has one set of jacks..... I cannot use a y connector because there will be a signal present on both sources on one of my settings... I know I could build an a/b switch and manually switch depending on which source I want to hear .... but, something automatic doesn't seem too far stretched... any advice here?????? thanks so very much! (I was also thinking in terms of a relay, which would 'kick' over to source 2, when 'on', thus shutting source 1... but, how good are the contacts in these things for audio? And, I think line voltage is very low.. is it enough to switch the relay over... unless I go with a relay that handles 120v that would 'kick in' when I turn on my second source???????'

some xe carts would work on 400's with as little as 16k(like star raiders II), most were 48k or more,some like flight simulatorII were 48k on disk,64k on cart,i could not tell the difference.
choplfter was a 16k cart,or a 48k disk,when atari got it,and put it put on the xe,it took 64k,and only added music in the intro as far as i coud see.
most of the retreads i could not see a difference,but some it did not matter like necromancer,i just wish that they would have released more of the retreads like they promised,like super huey,etc. if i ever find a super huey e-prom in all of my stuff,you will see it out,i promise.
check out my web site for memory requirements on all 400/800/xl/xe carts that we have in stock,thanks,

So, here are the details:

On the golden plate the following is printed:
SIDEWRITER
SCREEN SONIC INC.
At the back there is a DB25S (socket) connector.
At the bottom there is a small sticker with a serial number 0218 (hand written).
That's all I can see from the outside.
Still have to get a flat cable to test it out...

Ronen.

Really ???

I remember looking into FS II's code when trying to build a special
version for my A800 with "Alter Ego" OS-board. This board basically
adds the RAM "under" the OS which the latter XL/XE models have
by default. Unfortunately the adresses to do the bank switching were
different, so I had to do quite a bit of hacking - but never fully
succeeded. To me it appeared to have been writen in 6502 machine code.
Basic would have been much too slow at least for the video generation -
even if compiled. Microprose did their framework (e. g. the menus,
score tables etc.) using compiled basic but Sublogic ??? FS II is
not a Microsoft Product at all. The PC version was distributed by
Microsoft but still developed by Sublogic (Bruce Artwick was the
main programmer behind it). Today's MS Flight Simulator is however
a completely different story.

Greets

I have a limited amount of brand new Atari Jaguar items for sale or trade. These packages are ideal for new collector's or somebody wanting to start or add to their Atari collection. If you have any questions, please feel free to ask. I am also willing to trade for certain items, please see my list at the end of this post. All prices quoted are in U.S. funds with the buyer paying shipping.

If you are interested in any of these items, please respond to Jim at jim_l@NOSPAM.telusplanet.net?subject=Classics.Atari.Jaguar (removing the NOSPAM first). Or email me if you would like a current listing of items I have for other systems (Atari 2600/5200/7800/Jaguar, Colecovision, Intellivision, Classic Computers (Vic 20/C64/ADAM/Atari), Vectrex, Microvision, or Handheld games) sent to you, (please specify system).

** Atari Jaguar Packages - Brand New (all contain one controller, RF Box and AC adapter)**
==========
Box conditions vary, best condition boxes will be sold first.
-.Atari Jaguar with CyberMorph cartridge and Composite Video Cable $50
- Atari Jaguar with CyberMorph cartridge $40
- Atari Jaguar (No Cart) $30

** Atari Jaguar Games And Accessories - New/Shrink-wrapped**
==========
- Checkered Flag $10
- Composite Video Cable $15

Atari Jaguar Games - Complete but Opened Please make an offer
==========
- Doom

Atari Force Comics Please make an offer
==========
All are in Mint Condition
- Issue #2 - February 84
- Issue #3 - March 84
- Issue #11 - November 84

Trades
==========
I am also willing to trade for rare or shrink-wrapped/sealed titles for...
- Intellivision, Colecovision, Vectrex or various Atari systems
- Shrink-wrapped Intellivision NHL Hockey or PGA Golf
- Shrink-wrapped or mint SEARS Telegames for the Intellivision

- Shrink-wrapped or mint DigiPlay games for the Intellivision
- Shrink-wrapped or mint Intellivision Tutankhman, Super Cobra or Popeye
- Intellivision Congo Bongo, Draughts, Triple Challenge and Fathom
- Rarer Mattel and Coleco Handhelds (a list is available upon request).
- A complete brown variation of the Intellivision ECS
- A World Book Tutorvision (Intellivision III Clone)
- A complete Atari Jaguar CD Unit or Jaguar Accessories
- Atari Jaguar Games
- A working Vectrex controller
- A working DSS Satellite Receiver with H Card
- Working DSS HU / P3 Cards
- And of course the ever popular, original Intellivision keyboard (should I be so lucky :).

910. 1050 drive went dead. Now what?

Newsgroup: comp.sys.atari.8bit
Date: 2000-02-02 00:00:00 UTC
From: Mark Milbourne <milbourn@usit.net>
Message-ID: <3897895F.EA4F53B0@usit.net>
Source record: 46866

After 6+ years in storage, I resurrected my venerable 800 and was amazed to find that everything still worked and most of the disks were still readable. Was great to play all the classic games from days of old.

After a while I started playing a few levels of Lode Runner every day, leaving the thing on while just turning off the TV. Sometimes I may have turned off the 1050.

Anyhow, on about level 100 the 1050 stopped working. It still does it's little pre-spin when you power it on, but nothing else. 800 makes the funny little tumbling chasing noise through the TV speaker and comes up into the memo pad, so the 800 still seems to be looking for something to boot with, but the drive is not responding to the 800 power-on.

FAQ says the U1 chip or whatever can blow when plugging/unplugging cable while power connected. However, this failure did not occur in a such a situation.

Is this chip the most likely culprit still? How can I diagnose? I have logic probe and an old oscilliscope and a fair amount of technical saavy if anyone can steer me in the right direction.

Otherwise I guess I'm hunting another on ebay or somewhere. Please respond by e-mail if possible.

Thanks,
Mark Milbourne

Yes! Those were great fun way back when. I guess they were sort of
dumb games really, just cheesy redefined GR. 0 character sets -- but
for some reason I played them a lot. I'd really like to see those
again too if you come across 'em.

912. Looking for 130XE current mod for keyboard

Newsgroup: comp.sys.atari.8bit
Date: 2000-02-02 00:00:00 UTC
From: Brian Hutchinson <bthutch@earthlink.net>
Message-ID: <3897D262.52A4DF4@earthlink.net>
Source record: 46868

I read about this mod years ago to limit the current being pumped
through the 130XE keyboard. I have searched the web and the FAQ's and I
can't seem to find how to do this mod. Does anyone know the URL
containing this information?

Thanks,

Brian

flight simulatorII disk could work on either 48K or 64K. the 64k
version would add:
ADF
Reality effects
wingtip generation
bomb sight
war report
com radio
instrument panel lights ON/OFF switch
Course plotter

stright out of the FSII manual.

Asteroids for PSX (donated by Activision)
Intellivision Collection for PSX (donated by Activision)
3-4 Digital Press Guides (donated by Digital Press)
AND MORE STILL TO COME!

** INITIAL POST: 1.28.2000 **
Hey all! I'm here to announce the first annual PhillyClassic classic
gaming convention. Dave Newman and myself (Chuck Whitby) are
organizing an event to bring classic gamers together as a whole for a
weekend of trading, selling, and storytelling!

The weekend of April 14th, 15th, and 16th will be one to remember as
classic gamers unite for a weekend of hardcore gaming! Planned events
include casual trading/selling, *tournaments*, *auction*,
show-and-tell, and a general good time by all!

David Newman has rented us a 1000 sq ft conference room at Villanova
University for the event, which means enough room for a lot of people
to come and setup the pride and joy of their collections, and even a
little tradebait!

The convention center is COMPLETELY PRIVATE, has security, FREE
PARKING and LOTS OF IT, and is located in a higher class area,
so we shouldn't have any problems with anyone worrying about
their rarities being pilfered.

The schedule is as follows:

Friday: 7pm - whenever -- Setup Night
Saturday: 10am - 7pm (will probably go longer) -- MAIN DAY
Sunday: 9am - noon -- Packup, Final Goodbyes

If you have any questions or would like to help organize a part of the event PLEASE e-mail David Newman (davidnewman@adelphia.net) or me (intv-sama@worldnet.att.net). If you plan on attending, please purchase your tickets early and make those hotel reservations!

Thank you very much!

I can try to make ATR's of them later, have no time now. I also have a few others in the same type. King Arthur's Heir (or something), Escape from Vulcan Isle (??) and there's downloadable ones at : ftp://ftp.spudster.org/pub/Atari/CTH/Games/ATR/ and under F there's something called Fantasyland in many parts there.

I have the original's of some of them and made compilations with two or three on a disk side of some.

If it were me, this has happened plenty of times to me... I'd open the drive, remove each chip, clean the contacts with a cleaner, or pencil eraser, and firmly re-install.. I've also resorted to swapping chips from a working drive, if u have one handy.. a good tip from Brad at Best Electronics would be to put a dot of white-out on your good chips (or bad, if u prefer) while u swap them out... other things that have happened... the 3 (or 4?) capacitors (I think that's what they are!).. might need to be re-soldered in... or, you can carefully wipe the 2 rails the head travels on... I've used wd-40 which I've sprayed onto a q-tip (AWAY from the head!)... I'm sure some of the other guys here might have my head for some of the advice I just mentioned.. all I can tell you is that it's worked... unfortunately, I'm not a techie.. just a weekend warrier!

[snip] XE cartridges from Atari...

Hello Lance,
since you use US and thus NTSC Ataris, it`s no wonder, that you could not tell the difference between Choplifter (16k) from Broderbund and Choplifter (64k) from Atari. But there is a major difference on PAL machines:

Atari (64k) cart: Broderbund (16k) cart:
1) Title music (short & nice!) / no Title music
2) contains all levels... / shortened, less levels
3) "gr. 15" screen: color on PAL / "gr. 8" screen: no color on PAL
There also was a 24k Broderbund diskette version, thus the 16k cart version must have been shortened in some way (levels, music or so).
So, for PAL users the Atari cart is the better version, NTSC users may prefer the Broderbund cart or disk... greetings - Andreas

Hello Mathy,
yes these demos run on real Ataris too !! Just copy them back to real
disks, using MyDOS 4.5x (to read those 1024kb images). I prefer using
SIO2PC or Ape doing this job. Most of these demos of course need a
Gamedos to run (some merely run with 128 bytes per sector)... greetings

Sorry Mathy,
I have not played Fusebox yet, so I do not know the solution. But, there
exist two (or more) versions of Fusebox: the one from Antic and a
complete boot disk, with gr.9 title pics, etc. One of these versions
is compiled (unlistable), the other one is pure listable Basic code.
Maybe you can find the solution by listing the program... greetings -
Andreas

Hello Mathy,
you have to press [Control] + [B] or [Shift] + [B] to load a scenery
disk (if I am correct). Unfortunately I have come across bad disks and
carts, which just hang up, when you try this. But there are at least
versions that work ok (now I do own these correct cart+disk versions).
Pretty damn thing of the FS II is, that it is so veeryy
sloowww (compiled MS Basic)... Just watch the demo of the XE demo cart,
if you own it. Greetings - Andreas

> To email me just remove the Xs and underline marks from my email address.

Well,
I do not have much knowledge about cartridges and XE carts using
bankswitching techniques. But I do believe, there are XE carts, that do
not bankswitch all the time. Some of them have a sort of copy program
(or installation program) that copies all the code directly to RAM and
specific RAM area. So, it is possible that there are even 64k carts,
that do not work on 400/800 computers, because they use RAM under the OS
ROMs (or their copy programs copy the code into that area). Don`t beat
me if I am wrong here... - Andreas

Nope, The Nightmare is an old game by Epyx, but if you have that other game lying on the net, please point to the direction, I'd love to have that Mastertronic game too.

Hi!

I have a Homevision Repro Kit for the Atari 2600 videogamesystem for sale (no trade). This Kit contains all you need to copy Atari 2600 carts (mainly Homevision games, but works for some other too) on an attached empty (battery buffered, that means they are rewriteable) cartridge. Also included is a Homevision Game called 'Robot Fight' (#1, white case), all manuals and the original box. All contents inside the box are new and never touched (mint). The box itself shows some slight traces of wear. The price is $200, because this item of videogame history was produced in europe only and is there very hard to get too, as all Homevision stuff. Please notice that I live in Germany - shipping costs (insured airmail) to US/CA will be around $15. I have some separate empty copy cards also.

Thanks for your attention,

Andre

Welcome to comp.sys.atari.8bit, the Usenet newsgroup for discussion about the Atari 8-bit family of computers! These include the 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, 800XE, and the XE Game System.

Many topics are covered over and over again. To help alleviate this trend, several people volunteer their time and energies by maintaining Periodic Informational Postings for this newsgroup. Please take a moment to refer to these documents before posting to comp.sys.atari.8bit. The answer to your question may already be readily available!

Users of comp.sys.atari.8bit actively maintain the following Periodic Informational Postings:

Hello Frank,
I can not really tell if FS II is compiled Basic, but the german magazin
"Happy Computer" told me so (there was a sort of Flight Simulator
contest, which presented FS II, Fighter Pilot and Super Huey; all were
described to be very slow - which is true !! FS II was described as a
compiled MS Basic program...)

Besides I have seen much older computer versions (1976-1981) of flight
sim. programs, they were all written in Basic code and they did work
(without graphics, but they worked !) well and even faster... I have
also read old computer books (printed around 1975) that described flight
sim programs with Basic language... Why should one need Assembler for
that ?? greetings - Andreas

P.S.: I am not a pilot, just interested in flight simulators...
(Maybe I will make a pilot licence one day ?!?)

Besides,
there also exists a pirated + patched copy of M.U.L.E. that also works
on the XL/XE machines without translator disk, but with 4 players !!
Two players use joysticks, the others use the keyboard...
I had that copy once, but without any manual I just could not play Mule
(nor use the 4 player function), so I erased that copy... But the
opening screen stated, that this copy was a patched 4 player XL/XE Mule
(but untested)... Today I am hunting for originals, so do not ask me,
why I erased that copy... greetings - Andreas Magenheimer

I was not bad mouthing you. You advertised on this discussion group about your business, and I wanted to purchase an item. After a passing of one month and numerous emails being returned to me saying undeliverable, I thought you didn't have any intention of shipping my disk.

You explained that you were called away from your business, and you had 1900 emails to deal with when you got back. When you neglect your business at a customer's time and expense (even if it's not your fault), you run the risk of this kind of response. Your explanation sounds reasonable and understandable. My response was not an attempt to personally degrade you, but to report back to the discussion group (where I first found your advertisement), about the business transaction which I had no other way of interpreting. I would suggest that you be more careful in the future.

I do admit to all that you did refund my money. However, I was quite confused at first why you did. I never did receive the email about the disk being damaged and that you would refund my money (I read it in one of these postings). I'm sure that's not your fault though. Nonetheless, I appreciate the refund.

I neither have nor want an emulator.
If theses PC's are so good and fast and... why not put Atari files in Atari readable format on the Net. That way, Atari users can get them off the net and use them, while PC owners only have to turn them into XFD or ATR format. Why let the Atari do the work wenn you buy a PC because it's a lot faster?

I reread an atricle about FSII last week. In the ST version you could choose between a Lear Jet (a private jet, often used in "the A-Team") and some fighter airplane. Whys did they have to use a Cessna? Why not something more interesting? Like a 747, Hercules, or a Lear Jet?

I can't remember where, but there is a textfile somewhere on the net that discribes how to put an extra PIA inside the 800. This for the purpose of being able to switch (I don't know if that was via a switch or software or both) between "four joysticks" and "two joysticks plus memory management" mode.

Maybe that would be the upgrade you need.

>speed is amazing!

I don't know if I got that far, it's been a while. But I do remember that it got very very fast after a while. I wonder how he made sure that you could get to every point in the maze. You can not just put walls up at random places. You'd get alleys that have on connection to the rest, and thus a level you can not finish.

Why
> let the Atari do the work wenn you buy a PC because it's a lot faster?

While I can see your point of not being particularly interested in an emulator, I just got turned on to xformer and it is kind of nice. Many of things I disliked about the Atari are mitigated in the emulators; no more bad floppies, VERY fast i/o, very easy software exchange with others etc. Plus, I can play games at work now... Who cares about playing Quake/Unreal if you can play Rainbow Walker instead...? :)

But as nice as these things are, they don't compare to the real iron. I think the principal problem is the infrastructure on the Atari side doesn't exist to allow direct, native access to resources on the internet. But, I think a reasonable solution is a disk emulator that reads the xfd and atr formats- then you can run the REAL hardware, but maintain the software more reliably. Consider too, with the quantity of titles available on the internet, putting them in bulk quantites on a PC to essentially serve as a an Atari file server is very convienent- and is arguably one of the best ways to get real work out of a PC... ;)

Ok.
You say the 800 can control up to 16 switches.
I didn't do it, but I thought of a way to have the 800 control 64 switches.
Using an 8 by 8 matrix, you make, say, porta have 8 rows of switches, one
end tied to the output from 8 columns made by portb. You poll the
locations, rotate thru portb, which supplies a high side to one row of
porta switches/transistors at a time.
I think it would work.
I wanted a 8 by 8 chess board to sense piece movement with pieces with
magnets closing reed switches imbedded in the board. Then you'd be
able to print out the move list of a chess game.

> (Maybe I will make a pilot licence one day ?!?)

Hi Andreas,

I used to write game reviews for "Happy Computer " in the early eighties too.
From my experience not everything they wrote was quite accurate.

Regarding flight sims the most primitive thing one could do if you want
graphics to at least create the "feel" of flying is to simply generate a
horizon. This effect was used by Sid Meier in Hellcat Ace, Spitfire Ace and
Mig Alley Ace. Additional graphics to be overlayed over the basic horizon
were Player/Missiles. At Microprose they used Basic (later compiled Basic)
to write the frame of the simulator (score tables etc.) but I doubt the
horizon itself is basic (maybe somebody in this group knows for sure).
Doing this via the BASIC draw commands (maybe even using fill mode) would
be painfully slow. More sophisticated flight sims added ground detail
to the basic horizon (FS II, Solo Flight, Tomahawk, F16 Fighter Pilot).
This would additionally slow down the simulator as in every frame (when
movement of the plane occurs) not only the horizon needs to be redrawn
but also the ground detail needs to erased and redrawn. In reality
I think they did it using a double buffering technique (to avoid flicker),
drawing one frame while displaying the other. This way nothing was "erased"
but the complete frame was redrawn. This would be painfully slow if done
in BASIC and it still is slow in Assembler. Additionally you could use
"tricks" to speed up the display generation like to only draw things
that are not too far from the player's point of view (Mercenary does this
and it is quite fast!). Regarding ground detail, wire models were about
the best you could do on the 8-bit if you still wanted a reasonable
frame rate. For filled graphics with hidden line removal, you had to

reduce the amount of data by choosing a lower resolution (Rescue on Fractalus, Koronis Rift) or one had to avoid the horizon problem altogether (The Eidolon). Both "Fractalus" and the "Eidolon" (not a flight sim) also use only thin lines to create the impression of structure for the mountainscape or cave. Even more (atari specific) tricks were used in pseudo flight sims like "Stealth", "Buck Rogers", "Dimension X" or the tank sim "Encounter", although the Dimension X scrolling effect is implemented in far better way in "Ballblazer". Too bad one of the best pseudo flight effects of that time never made it to the Atari 8 bit: "Skyfox" by Electronic Arts. This was originally created on the Apple II and clearly showed what one could achieve on an 8 bit machine which did not have the most sophisticated video hardware if compared to it's competitiors A800 and C64. Of course all the games mentioned had to use assembler programming to be at least halfway playable on an 8bit machine.

The Commodore monitors work great with the Atari. I have a Commodore 1802. I use it for Atari,Nintendo, and watching movies(VCR). I know its not a big screen but, it does the job when all the other TVs(3) in the house are in use. I bought it at the Goodwill with the cable for $9.99. And its been going for about 3years now.

I have and use a Roland DG, Sakata SC-100, Magnavox RGB80, and a Teknika MJ-22. All of which are 13" color composite monitors, but the Teknika and Magnavox stand out more. The Teknika has inputs for 8 pin DIN RGB, as well as separate chroma and luma inputs from an Atari as well as the composite in and audio. The magnavox doesn't have the separate chroma and luma inputs, just composite and audio, but it does have TTL RGB 8pin DIN input and 6 pin DIN RGB input that I use with an adapter cable for my Atari 1040STf, when I'm not using it with my 1200XL, it also has a button you can push so that the monitor only displays a mono green screen for use with text (typing in a basic program,word processor....). So actually decide if you want just a simple monitor or one that does a couple other things also then go look for one that does what you need. I play my playstation on all of these also, the picture quality is great compared to a standard TV. But nothing beats Gran Turismo 2 on my 60" Zenith ;-)
Check out Ebay they always have composite monitors for auction, or if I remember right one of the Atari vendors that are still around sells the Magnavox I mentioned above (great monitor), good luck.

AMS files are cool, and in my opinion make the Atari 8-bit unique.
I haven't seen too many people try to port the AMS player to other
platforms. Perhaps too simple?

Nevertheless, they are to the Atari what MODS were to the Amiga, and
I love to hear some people's interpretations of music, since AMS files
are more of a artform than an exact science (to quote GalaxyQuest). ;)

I was able to find three disk images on the XLSearch page (with the
12,000 entries of 8-bit files)(They have a mod player in there for the
8-bit too by the way...) to find the URL, check out the

http://www.atari.org

... site. In the news section I believe the XLSearch page is still
mentioned.

Good luck!

I have been rather impressed with the SC 1224 Monitor for the ST.

However, the only problem is, though this monitor was advertised to work with either the ST or 8-bit with monitor jack (which excludes the 400 and 600xl) ...

... NO ONE IN RECENT HISTORY SEEMS TO REMEMBER HOW IT WAS DONE!!

And here in Dallas we have several members who would like to know how it was done.

In the meantime, I have a video monitor connected to a VCR (to act as a tuner). Works well. (Magnavox / RGB Monitor 80)

Take care!

Source record: 46753

It is an Intel type part, so it uses seperate r/w lines. Other then that it is like the 6520 but with 3 ports vs two, a little more versitle too.

Just trivia, but at one time Commadore Semi came up with a preliminary data sheet for a 6520 type chip<6530?> with 3 eight bits ports vs 2 and control lines. I have tried to find this part, but it is scarce to the point of being non-existant. I don't know if it ever made it to commercial production.

There may be other ways of doing it too, kind of fun for me to think about them. But let's say you have a EPROM or two or three with the CS lines and address lines tied the switches. All of the data pins tied to the joystick port. As the switches change status, they change the address lines such that you get one of 256 different outputs on the data lines. It is kind of a goofy idea since you would need 256 input pins to make it work, but the address on my house is goofy street anyway.<grin>

You could probably get the design down to something a bit more reasonable by doing some switching with the JS i/o ports and reading using the triggers and pots, but why be reasonable?

986. Reading Atari 8 bit disks

Newsgroup: comp.sys.atari.8bit

I have a Atari TT and want to read my Atari 8 bit disks with my TT. I have a 5.25" drive(IB) for the TT. Is there some type of program I can use to do this. I have tried ST Xformer but, it bombs on the TT.

Thanks Don

I'm wondering if someone who can get to this binary group, can upload
the file to the umich atari archive for the rest of us? I can't get to
any of the atari binary newsgroups with my current isp (and I expect
there are a good number of others in the same boat). I've just gotta
have my 8bit Y2K compliant!!

989. bit copy of .atr

Newsgroup: comp.sys.atari.8bit
Date: 2000-02-05 00:00:00 UTC
From: audiophilia@yahoo.com
Message-ID: <87g89ebbq1@nnrp1.deja.com>
Source record: 46837

Hello,
Here's the deal. I have APE running. It's cool. But, normally I have my 800XL in a different room. I would like to copy some of my .ATR's on to real disks so I can play them without having to tie up my computer. I know this might be interpreted as piracy. Hell, it is piracy. Unfortunately, Alternate Reality and Ultima and many others aren't exactly readily available. But, anyway. Bring on the flames.

Anybody know of a way to make an identical copy from ATR to floppy disk? I think the copy protection is messing me up or something. What I have been doing is just duplicating the disk through MyDOS 4.5. I should have known that this wouldn't work, but I don't know any other way. I checked the diskutils in UMICH but found nothing that looked like it would suit my needs. I think I need some kind of bit by bit copy program, but I'm not sure. Anyone who has been successful at this, tell me your secret. They got the disk into ATR format, there's got to be a way to get it back out. Thank you.

: Harris still frequented the group. It was always great chit chatting with
: someone who knew the Atari inside and out.

I had a nice correspondence with him by e-mail a few years ago. I found a couple of interesting things:

1) He still programs on the Atari. A lot of places like hotels and hospitals like having an inexpensive and reliable machine running an electronic bulletin board that runs announcements and that sort of thing through their TVs all day. I saw one those in action myself when I was hospitalized last year: the unmistakable Atari fonts, graphics 0 and 1 combined modes and colors, the smooth scrolling.

2) He totally denies Steven Levy's accounts of the Frogger fiasco in the book "Hackers." Harris told me he lost the most recent copy of his work, and DID have back-ups. Unfortunately, those back-ups needed several weeks worth of re-doing to make it current to the one he lost. So it was a bitter loss.

3) He also denies ever having an infatuation with Roberta Williams. :)

: I haven't seen too many people try to port the AMS player to other
: platforms. Perhaps too simple?

AMS was one of my favorite things about the Atari, particularly the player piano. Some may feel the Antic Music Processor was cool, with its bouncing bars and lyric capability, but I always liked watching the piano instead. It was also a nice visual way to figure out songs if the sheet music wasn't available.

I haven't been able to find a MIDI player for my PC that would do what AMS did yet...

Atari Hardware and Software for sale

http://www.voicenet.com/~generic On-Line Computer Garage Sale

We are retiring and moving south in the early spring and really need to clear out most of what we have. I would rather ship it to you than move it to the new house. Drastic price reductions have been taken on almost everything in our On-Line Garage Sale. In addition there is a quantity discount in effect until the end of January if you spend over $50 (not counting shipping). Discounts as high as 55 percent. See my web page for details. While you are there play some games, try some trivia and look at our wedding picture.

From: Boyd Staley <BoydStaley@worldnet.att.net>
Message-ID: <389D05B1.14F5E59E@worldnet.att.net>
Source record: 46759

I picked up an item the other day and was wondering if anybody might have some info on it. It is a small blue box with 6 Atari male SIO connectors around the sides. on the top are two toggle switches. Inside the box is a single printed circuit board on which all of this is mounted. The word Quintopus is printed on the board as well as the name of the company that made it ("computer services" or something like that I can't remember right now.) 4 of the SIO connectors appear to be connected in parallel on all pins. The other 2 ports are also connected in parallel with the exception of a couple of the pins which can be switched in and out by the switches. I'm guessing that it is supposed to allow you to share peripheral devices between 2 computers. Has anybody ever used or heard of one of these before? Any info would be helpfull.

Thanks,
Boyd

Hi Mitchell,

Most of the earlier models from the Color 1 up to the Amdek 500 (that unit has RGBi and composite input), I think the last one to be compatible was the Amdek 600, but it may have been the 500 was the last, after that they went strikely RGBi and then they starts coming out with the VGA line. Later on they were bought by Wyse and that was it. I was never a Commodore fan, but I have to say, the 170x and 180x line of monitors were THE best composites to use on the Atari 8-bits.

Hi Boyd,

Its an SIO splitter and repeater (it refreshes the signal on each port so that the connection to all of your peripherals stays strong and constant) it was for people who didn't want to daisy chain, but preferred to hook everything up to one area. However, it was quite handy it you had a bunch of non-daisy chaining periherals like the XM301, 410 tape decks and so on, then you could hook them up without having to have them at the end of the daisy chain.

Or you can always ask me for a copy at mailto:mcurrent@carleton.edu

------------------------------

Subject: Introduction

Conventions
-----------
All commercial vendors, developers, publishers, and repair shops should be
listed here. "Major" PD/freeware/shareware developers should also be listed.
Persons or entities holding rights to products, but not selling or supporting
them in any way, are NOT listed here.

"Vendor" = Reseller of products produced by others. Types of products
sold are given in categories: new hardware, used hardware, PD/freeware/
shareware, (new) commercial software, used (commercial) software.

"Developer" = Producer of products. Titles of products produced by the
developer are listed. No product can be developed by more than one
developer. No prices are given.
```

"Publisher" = Publishes a print or disk magazine, or a book. Complete subscription or ordering information should be given, including prices.

"Repair Shop" = Can repair many 8-bit Atari and related hardware devices. Be sure to make advance contact before sending anything to work on!

Entries are presented alphabetically by company name, or publication title. If no company name exists, a personal name is used. "See" references indicate complete information may be found under the given heading. "See also" references indicate closely-related information may be found under the given heading.

When writing to request catalogs, it's always a good idea to include a Self-Addressed Stamped Envelope. When writing to foreign firms, try enclosing a couple of International Reply Coupons (IRC's) as well.

Super-Brief Copyright Primer

Commerical software - protected by copyright, may not be copied except for personal archival purposes
Shareware -protected by copyright, may be freely copied and distributed, shareware payment required for continued use
Freeware - protected by copyright, may be freely copied and distributed, no payment required for continued use
Public Domain software - NOT protected by copyright, anyone may do anything with it, period.

Software is protected by copyright from the moment of creation. No copyright notice is required for copyright protection. Software does not enter the Public Domain unless explicitly released to the PD *by the copyright owner*.

My article "Intellectual Property Protection for Computer Software" appeared in Atari Classics, 3(1), 1994, pp. 4-7, or see:
http://www.library.carleton.edu/staff/michael/acarticle.html

Verfications -> YOU!

This list is in a constant state of development, and comes with no guarantees. Information of this nature constantly ages; therefore, the information contained in this list is constantly updated. Please use the latest release of this list whenever possible!

"Hi!" to Marek Tomczyk, who has supplied so much information from Germany.
"Hi!" to Alex Martin, who has done the same for the land of Poland.

Remember, the success of this list is dependent on YOU, the reader, to send me updates that correct errors that you find. If you use this list, please do your part in keeping it useful for everyone!

Well, don't feel too bad, Curt. The Commodore monitors weren't
actually made by Commodore. IIRC they were made by Magnavox.

1008. Re: Quintopus?

From: Alan Sharkis <asharkis@erols.com>
Message-ID: <87jt8scuu1@bob.news.rcn.net>
Source record: 46769

Before giving my Atari hardware to my user group, I used a Quintopus. It worked very well for me in a special situation.

I needed to use an SIO2PC cable, and I also needed three 1050s, a P: R: connection another printer interface (forgot name) that allowed ATASCII characters to be printed along with straight text, and a Wizztronics Midi interface. All of these, with the exception of one 1050 and the midi interface, were directly connected to the Quintopus, as was the computer.

IIRC, the Quintopus came in two flavors -- switched, like the one you have, and unswitched. Because my SIO2PC was an early one, it was necessary to switch it off and switch the P: R: on when the P: R: was needed for my modem or a null-modem connection. I switched it the opposite way when using the SIO2PC cable.

The company that made the Quintopus was Computer Software Services. They also made an SIO Line Booster at one time, among many other fine products.

Looks like you've found yourself a deluxe version Quintopus with
switchable ports, retail price $59.95

It is still being sold today from CSS here:
(note that you can read the scanned manual page there as well!)

Last Updated 02/06/00
- Sold/traded items removed

I have the following Atari 8bit components and cartridges for sale. All the equipment is cleaned and detailed, and in good or better condition, but without boxes unless noted. If you have any questions in regards to unit condition, please feel free to ask.

All prices quoted are in U.S. funds with the buyer paying shipping. For items that I am taking offers on (no price listed), please make all offers in U.S. funds. I am also willing to trade for certain items, please see my list at the end of this post.

If you are interested in any of these items, please respond to Jim at jim_l@NOSPAM.telusplanet.net?subject=Classics.Atari.8bit (removing the NOSPAM first). Or email me if you would like a current listing of items I have for other systems (Atari 2600/5200/7800/Jaguar, Colecovision, Intellivision, Classic Computers (Vic 20/C64/ADAM/Atari), Vectrex, Microvision, or Handheld games) sent to you, (please specify system).

Hardware Please make an offer
==========
- Atari 600XL - with power supply, RF cable
- Atari 800XL - with power supply, RF cable
- Best Data Smart One 2400X - 2400 baud modem

Controllers Please make an offer
==========
- Paddles (multiple sets) - for Atari & Commodore units
- 2x Suncom Tac Joysticks - for Atari & Commodore units
- 1x Spectravideo Joystick with suction cup base - for Atari & Commodore units

8-Bit Cartridges Please make an offer
==========
- Basic with Basic Reference Manual
- Final Legacy
- Megamania - In a sealed/shrink-wrapped box, box is slightly squashed.
- Realsports Football
- Star Raiders
- Tennis

8-Bit Books Please make an offer
==========
- Compute's "The Atari Basic Source Book"

Atari Force Comics
All are in Mint Condition
==========
- Issue #2 - February 84
- Issue #3 - March 84
- Issue #11 - November 84

Trades
==========
I am also willing to trade for rare or shrink-wrapped/sealed titles for...
- Intellivision, Colecovision, Vectrex or various Atari systems
- Shrink-wrapped Intellivision NHL Hockey or PGA Golf
- Shrink-wrapped or mint SEARS Telegames for the Intellivision
- Shrink-wrapped or mint DigiPlay games for the Intellivision
- Shrink-wrapped or mint Intellivision Tutankhman, Super Cobra or Popeye
- Intellivision Congo Bongo, Draughts, Triple Challenge and Fathom
- Rarer Mattel and Coleco Handhelds (a list is available upon request).
- A complete brown variation of the Intellivision ECS
- A World Book Tutorvision (Intellivision III Clone)
- A complete Atari Jaguar CD Unit or Jaguar Accessories
- Atari Jaguar Games
- A working Vectrex controller
- A working DSS Satellite Receiver with H Card
- Working DSS HU / P3 Cards
- And of course the ever popular, original Intellivision keyboard (should I be so lucky :).

Thank you guys for your attentiveness! *blush*
I appreciate the help. I'll see if I can grab a monitor this coming weekend.

I guesse there is the semitangible sense that soon the opportunity to get a piece of electronic nostalgia is gradually slipping away, growing surer each day. Someday, sooner than comfortable, it will all but dissappear. :c Anyone stocking up on items, left unused until the become necessary or not used at all? How freqeuntly DO you use your computer? Daily, or just when one needs a nostalgia fix? Sorry there I go asking more questions!

Tasha

Howdy Richard, folks

>Just trivia, but at one time Commadore Semi came up with a preliminary data
>sheet for a 6520 type chip<6530?> with 3 eight bits ports vs 2 and control
>lines. I have tried to find this part, but it is scarce to the point of
>being non-existant. I don't know if it ever made it to commercial
>production.

There is a list on one of the sites dedicated to the Commodore 64 and/or 128.
But I forgot where. That has a list of (almost) all 65xx chips made by MOS
Technologies/Commodore Semiconductor Group.

>You could probably get the design down to something a bit more reasonable by
>doing some switching with the JS i/o ports and reading using the triggers
>and pots, but why be reasonable?

If you only wanna read you can try this:

(if using one joystick)

Use the 4input, 16 output version of the 74xx138 (which is only 3 inout 8
output) to power one of 16 switches. (Oops I forgot wether the selected line
becomes low or high)
read the status of this switch via the trigger pin.
Since there is only one switch selected at any one time, one input should be
enough.

Be carefull though. The above is just the concept. How this looks in reality
is something else.

In a recent post I saw CUMathy Van Nisselroy ask "why let the Atari do the work
wenn you buy a PC necause it's a lot faster?"
:
I'll tell you why... because it's a pain. Especially if you don't have nor
want a PC at home. :) Granted, I could translate it at work or on my ST, but
why? Not not have archieves on the net that have the files in 8-bit archieved
or compressed form?
:
Of course, I guess the Atari could translate those ATR or other files, I have
seen the programs out there to do it.

FamilyNet HQ: Telnet:\\209.217.2.202

Don Schoengarth,
:
Hi there! I am a verterian TT user and I know what you are going through with
trying to get a TT to read 8-bit disks. The answer as best I can tell is, in
the ST world, while there are many emulators that are getting to the point
where they are running 8-bit emulation at near true speed (I understand EmuXL
is good) only one offered the ability to read 8-bit disks.
:
X-Former was designed in such a way that it relied on more mechanical timing
than anything. So an ST doing anything other than 8 mhz will not work. :(
:
Alas! You have two other solutions....
:
1) Pick up a 1040ST for $15 to run X-former and get the X-former canle (cable)
and the 1050 disk drive.
2) Get an 8-bit system with 1050 drive and serial interface and send
the files to the TT via null modem connection. or three....
:
3) Get a friend to convert them for you. :)
:
Good luck!

I'm not sure I follow Greg, Rick and Mathy.
But if you're talking about a chip that connects to the A8 and then from there controls switches, the A8 could control up to 65536 such switches. I mean, if you attach all 16 pins of the a8 joystick ports to a device that just needs a number to control a switch, then the 16 pins of the joystick port could provide 16 bits of a number from 0 to 65535.

Thats true from a logic perspective, but it also means you've dedicated all 16 wires for output. If you want a combination of input and output (more likely), then things get more complicated. You could use some of the pins for output, others for input- which is the simplest and very desirable from a complexity standpoint, but if you need more than 16 lines of I/O then a fancier solution is required.

An 8255 takes a different approach, its a peripheral chip intended to hook up to an 8 bit computer buss. Its arranged to decode several addresses (binary combinations on its address lines) which control its operation (which pins input vs output, bitwise or register I/O, other fancier stuff...). You control the outputs (read the inputs) by interacting thru the 8 bit buss. This means you hook the 8255 data lines up to 8 I/O pins (first 2 joystick ports). The chip's Rd/wr and chipselect are connected to another 3 pins, and the address lines consume a couple more.

Then, you write your program with a "driver" layer down at the lowest level (do it in assembly if possible- for speed) which operates these lines just like a microprocessor would. This includes changing the 8 data buss pins from inputs to outputs as required, and manipulating the various control lines at the right time. The chip's signal sequencing is very clearly defined in the datasheets.

A somewhat better (if more ambitious) solution would be to hook the 8255 onto the Atari's address/data buss, because then the 8255 could be operated much more quickly just with peek() and poke() operations- you could probably even rig it to issue interrupts to the Atari and achieve high speed parallel I/O to a printer, for instance...

But, with a working 8255 you get 24 bits of I/O, you can arrange them in all sorts of ways, bitwise I/O, register level, individual assignment of pins to be either read or write, even interrupt flags back to the Atari if inputs change state (or flags going out if the Atari changes them from "inside"). In fact, the 8255 is intended to be a general purpose digital interface,

building in lots of flexiblitity so system designers don't have to build it from scratch.

The 8255 is very cheap (its a rather old design) and you can get them mailorder nearly anywhere. Intel probably still has the datasheets online, I believe other manufacturers sell compatible chips, so theres a lot of documentation out there for it. I scrounged some early 1980's Intel databooks at a secondhand bookstore. If you want to get one, try for a CMOS version (the I/O voltage/current specs will be much better than the old NMOS or TTL devices)- the part # will be something like 82C55, the C denoting CMOS.

To construct it, all you need is a little circuit board (its a 40 pin chip), a socket for it (make it easy to replace when you nuke it by accident... ;)), some hookup wire and nominal skill with a soldering iron. You will need a +5 DC supply for the chip, and it must share a ground with the Atari joystick ports. Really though, if you're not familiar with microprocessor interfacing, do some reading first- its not all that complicated, but there are some issues which must have attention paid to them.

So, its a more complex approach then 16 i/o lines straight out and really unnecessary if you need <= 16 I/o pins- but if you need more, its a nice solution, and very flexible.

(quoter turned off).
(Gregm explains more about the 8255).
thanks.
Sounds like the 8255 is a microprocessor. And I don't know how
microprocessors work. I imagine that these are 8 bit ones, with an
instruction set that determine which i/o pins do what. Sending 8 bit
instructions to the 8255, which has other pins that do other stuff.
Anyway, this is what keeps me interested in the A8.
I don't know how it works. I assume it is a basic computer, and that
if I understood it better, I'd be able to extrapolate to any computer.
It is right out in the open. I mean you can, with a magnifying glass maybe,
see all the traces on the board, some are covered by chips and resistors
and stuff. And just imagine all those bits going high and low and stuff
going up and back on the data and address lines and neat stuff.

1037. Soliciting APE reviews

Newsgroup: comp.sys.atari.8bit
Date: 2000-02-07 00:00:00 UTC
From: Mike Kohary <mkohary@earthlink.net>
Message-ID: <389F9680.8DF3F291@earthlink.net>
Source record: 46705

I'm considering a purchase of the registered APE and accompanying cable. The two together will cost me a cool $100 including shipping. General question: is it worth it? Here is some context for my question:

- I have about 100 Atari floppies that I want to convert to .atr files on my PC.

- I would like the ability to transfer .atr files back to real Atari floppies; however, this ability is not necessary, just frosting on the cake.

Additional questions: given my desired task(s), what will the registered version of APE give me that the unregistered version does not? How reliable a businessman is Steven Tucker (i.e. product delivered in a timely manner, well constructed and worked as expected)? What has your general experience with the product been, and would you recommend it to others? All comments and reviews are welcome.

Thanks for any response. $100 isn't a fortune, but it's a goodly amount of money to simply spend on my Atari. Still, getting those floppies over to the PC is pretty important to me, for preservation purposes.

Mike

MyDOS will do sector copies of DOS or non-DOS disks. All you have to do is give it a starting and ending number. If you want to copy the entire disk from drive 1 to drive 2, for instance, try "J" followed by "1,2(1-720)." Note that MyDOS automatically formats the destination disk unless you also use the "/N" modifier, as in "1,2/N(1-720)."

If you don't give a sector range, then the sectors marked as in use in the DOS bitmap (on the VTOC sectors) are copied. This method, of course, only works for DOS disks.

I would like to shop for a monitor for my Atari 800XL (which has a 5-pin monitor plug in the back). I'd like to know what I need to look for; I'm sure not just any monitor will do. I saw an earlier thread that mentioned a lot of specific names, which is helpful. But I'd also like to know, in a more abstract sense, what I need? What features do I need, and more importantly, what features might not be compatible? Does it *have* to be a composite monitor? I'm not very monitor-savvy, so please forgive the silly questions. If someone could propose a checklist of sorts, I'd be most grateful. Thanks,

Mike

Sounds like youre doing everything right except youre using
a program to duplicate the disk that cant actually duplicate a non-dos
disk. Instead of using the 'Duplicate Disk' function of MyDOS, ues
the 'MyCopier' program found on the APE_WARP.ATR image.

[since you started the new question...]

I think the main problem that keeps me from using my Ataris more often is
that I can't dedicate the space to have one of them set up with a
monitor. The computers themselves are small, but with a monitor and disk
drive, they start to take up a lot of desk space. It's just not the same
using my 26" TV, and it looks terrible on that anyway. I always had a
small screen, starting with a B&W 12" TV for the 400, then going to a 13"
color TV for the 800, and ending up with an actual color monitor for the
1200XL.

So I guess that I only use mine when I want the nostalgia "fix." Usually
it just means me playing some games, because the computer is never set up
long enough for me to remember how to do anything more useful. I hope one
day to have a house with enough room so I can dedicate the space to have
at least one Atari set up full time.

What really makes me feel bad is how little I use my arcade games [ok, a
little off-topic, but they're all 8-bits from 1980, so I think it's not
too far off base for this group]. I've only got three of them (so far),
but they take up a good chunk of the room. At least the Ataris you can
put in a box in the closet, and forget about. Weeks will go by when I
haven't even turned on the arcade games, and they really stick out like a
sore-thumb when they're sitting there "dark" taking up an entire wall.

-Rhett.

BTW: for the original monitor question, I always thought that the Amdek
was the "real" monitor. I remember seeing an Apple II with one on TV in

1979, and being really impressed with the colors. For me it just looked like THE "professional" monitor. I still couldn't afford one when I finally got my self a real monitor for my Atari, but my NEC did nicely. I'm wondering if a 12"/13" color TV with composite inputs wouldn't be a suitable alternative in the modern world? Most everything seems to have composite inputs today.

Source record: 46593

FamilyNet HQ: Telnet:\\209.217.2.202

Steve,
you swear by a Magnavox RGB 80?
:
Cool, that is what I have. Tuned by a old VCR to my Atari 400. The picture is
quite good.
:
Mine was given to me by my brother in law since he needed it out of his house.
I had it for a while, had no earthly idea what I would do with it. Actially
came close to tossing it, though I didn't since it seemed to be a waste and I
hate throwing way technology.
:
Then I hooked it up to a vcr with a cale I got in a box of someone's collection
that was mailed to me, and well, the rest is history.
:
Sometimes I shed a tear for the black and white TV I used for nine years
faithfully. I look at the channel knob I have in the jewel cabinet, and
remember Star Raiders and Archon in black and white.
:
Then I get over it, but the knob back in the case, and enjoy my new monitor.
:)

Mike,
Hi there, I saw that you said you had a working 1450 XL motherboard. I know of someone else (Ed Williams) who actually had an unpopulated 1400XL motherboard. As far as daughterboards, good question. You might want to see if Curt Vendel (Atari Computer museum) has any leads.
:
Would be nice to see another 1450 XL in action. How are you doing on the casing?
:

Several people have indicated that the
9V DC power supply for the 5200 game
machine can be used with the Indus GT
drive. And I don't doubt that, but (and you
knew there was going to be a 'but')
I have an Indus service manual, and
it mentions to check voltage being supplied
to the drive with the power switch "off"
at 14.5 to 15 Volts DC. When 'on", it
should be 12.2 to 13 V DC. I don't
see any way the 9 volt unit could supply
this. (?) Just very conservative?
Anybody actually run a GT for an extended
period of time on the 9 Volt DC supply?

Are you loading them right ? Most commercial games uses START/OPTION pressed
in when powering up the XL. You should hear a beep. Try to rewind the tape
completely and step a few on the counter forwards. Press play and any key.

Basic games can be loaded with START pressed in while powering up (few
games, but some exists) or powering up the machine and typing cload. Also
LOAD "C:" or ENTER "C:"

Head alignment is something you could check. Try listening to the sounds
while adjusting the head and get a clear as possible sound.

Some tapes can be defective too of course, if you kept them in a moist or
cold place.

Mike,

Steven Tucker is a very reliable business man IMHO. I live in Brazil, and I never experienced problems purchasing APE, and receiving its upgrades (I build the cables myself). He's now working in a Windows native version, that I received (a beta version) as a registered user for testing purposes. He's also very friendly as technical support.

You might download the unregistered version, or read the docs that are available at his home page. There you will find the limitations of the unregistered version for the currently available APE.

Mike,

You need a composite color monitor with an audio input to
amplify the sound from the Atari, it should have RCA inputs. This
basically describes every composite color monitor ever turned out.

The Atari can also provide a 'chroma/luma' split signal that
is compatible with a few high end monitors. With a modified Atari
these monitors can provide a superior picture, assuming they are
in as good condition as a composite of the same price.

Another thing to consider is even a 'good' monitor might
have a terrible picture. This is just a hard fact of dealing with
such old equiptment. I've seen good C= monitors that were terribly
out of focus, had poor convergance, or has other problems that
would never be obvious even in a auction with photos since even good
auction photos tend to hide a lot.

I SWEAR by the magnavox RGB 80, it has the best picture i've
ever seen, and thats on straight composite video. It rivals all
the best C= monitors I own, and has an RGB mode that I use occasionally
with my ST as well. I got mine brand 'new' at a thrift for $5,
never used.

If you have time, check out your local thrift stores. You can
at least see that your getting, and many of these stores have big
shelves just full of good old monitors. A local thrift here has
has a C= monitor and C-64 system sitting for weeks marked at $20,
another has a shelf of decent monitors for $5-$10 each.

Steve

I have nothing but good things to say in my dealings with Steve. I registered for APE a few years ago and have been very pleased with his upgrades and technical support. Also I purchased his 4-in-1 3x Warp OS and was even more impressed. I had a little trouble installing it in my 1200XL, and he finished the install for me in record time at no charge! I just paid shipping. If you are using APE, I wouldn't just recommend registering, but insist that you *must* register to support Steve's continued efforts. The 8-bit platform has precious few active software developers today.

error 21 means 'not LOAD format'. It means you need to CLOAD or
ENTER "C:" from BASIC READY prompt.
error 143 means a data frame checksum error. The tape may be bad,
or try a different SIO cable.
error 131 means you tried to output to a channel open only for input.
Like someone said, if these are commercial tapes, they are probably
binary load files, which means you hold OPTION and START when
you power up. You should get the beep, then hit ENTER to load.
(OPTION at powerup disables BASIC.)

Not important for mine. I have kind of esoteric tastes.

But basically it is using an EPROM as a poor mans programable logic device.
For instance, I think you could replace our MMU on a standard Atari with an
EPROM with the address lines tied to the right bits of port B. It comes up 1
output bit short IIRC, so you would lose basic or something.

> > 65535.
Been there, done that, huge problems. Specifically, I tied a TI serial A/D
chip to a joystick port and at one time worked on a design that used a
serial to parallel
chip<74SL164> hooked to a J/S port for a printer interface: Both designs
failed badly.

The problem is the anti RFI and protection circuits on a J/S port is roughly
equivalent to an automotive ignition coil when you drive the ports as
outputs. They have the same problems as an coil, ringing. It is imposible to
send out a single clean pulse from a J/S port. For debugging, I had a '164
with LEDs on all outputs. A single clock pulse since from the 6520 would
shift bits out the first 4 flip flops.

You could probably work around by removing the inductors/caps/resistors from
the J/S ports, but at that stage I just added a 2nd PIA chip and everything
worked fine.

J/S ports do work well for things like RS232 because of the start
bit/centering way they operate. I imagine you could debounce them, I did
several experiments where I got close to a clean clock this way, but never
trusted it.

Right now I have been toying with the idea of 68HC68T1 real time clock added
to an Atari. Cute little thing, 15 pins and serial communication with the
host computer. But one of the things that worries me is possibilty a little
project piggy backing a 16 pin devices to the PIA will end up a with a 2nd

PIA to take care of the noise problems.

Adding an 8255 to the buss after you take care of the separate R/W lines would of course works as would driving it from a 2nd PIA chip as would driving it from the existing PIA chip if you removed the RFI junk.

1066. Re: Power Supply for Indus

Newsgroup: comp.sys.atari.8bit

Source record: 46725

I have an Indus pwr supply. It is 11.5 v DC 1.95 amp.
The comp.sys.atari.8bit FAQ has the power requirements for the Indus.
Just don't hook a 9 v AC to it or the Indus PS to a 1050!
If someone says 9v DC will work, I don't know. The service manual
sounds right.

The 8255 isn't quite a microprocessor in that it doesn't run an internal program; its a big pile of logic gates that can be configured in different ways. Configuring it is sort of like programming though, you load particular values into particular locations to make it behave a certain way. You do much the same inside the Atari when you poke() stuff into various registers. The thing I like about the Atari is its nice and simple- as I read somewhere "You can carry the whole OS around in your head.." Not that my memory is that good, BUT, its easier to hack on in some ways...

Once you get your head around the notation, you can see the addressing arrangements inside the Atari too; both for the peripheral chips and the memory too; the techniques are very standard.

Chips like the 8255 are nice because your average hobbyist can use them without any special equipment or training. Electrically, they're not that much more complicated than a SIO2PC cable; more connections of course, and few more parts, but essentially the same magnitude stuff.

Interesting. My father controlled a pile of digital circuitry directly from an 800's joystick ports and didn't have any trouble like that. Are you sure you weren't having ground/supply noise?

Gregm

1069. Trak-Ball mode

Newsgroup: comp.sys.atari.8bit
Date: 2000-02-08 00:00:00 UTC
From: wiseguyUSA@xoommail.com
Message-ID: <38a0507d.10424163@news.earthlink.net>

the Atari trak balls are switchable from
joystick mode to true trak ball mode.

What games for the 8bit support "TB" mode?

Missle Commend is the only one I have found so far.

This last bit that you wrote; APE enables the Atari to use peripherals
that are hooked up to your PC, correct? Does that really work as
smoothly as I make it sound? i.e. I can print to my PC printer from my
Atari, and I can use my PC's modem from my Atari?

If that's true, that sounds incredible. Better count my pocket change.
;)

Just a guess, but he could have been using the PORTB vs PORTA of the PIA
chip. PORTB is an active output port while PORTA just has passive pullups on
chip for the logic 1. The combination of passive pullups with the
inductor/cap/additional in line resistor on the J/S isn't really a very good
combination for driving things. PORTA is really made for directly driving
CMOS or other low load logic families where you have to be sure there it
will run up to over 2.5V if you read the 6520 lit. It sinks great, just
doesn't drive well.

I actually got the J/S serial A/D chip working after a fashion, but I had to
do a moving average of readings vs getting a hard value in a single read
cycle. You get 1000 readings where 800 are equally bad on either side of
right with 200 that are right, eventually your average approaches the
correct value. 2nd PIA chip solved all the noise problems though.

I also did things like adding opto isolator/triac 120VAC control to a J/S port. In that case, it didn't matter if I got some noise, since doing things like turning on a light bulb with a few nano secs of bounce was indistiguishable from doing it with no bounce. They are very useful and can be used in many ways, but I don't think I would reccomend using them for things like driving a digital logic chip that would be used in something like a burgular alarm switch scanning circuit. Thing is, you get one glitch in a day that sets off your alarm and calls the police, it would probably be too much.

Fairly easy to check, 8 LEDs, 74LS164 chip, and 9 pin connector with just data, clock, 5V and ground.

Hmmm, the printer started to do something, but as it's an Canon BJ-6000 I guess it's not working because it's not a DOS compatible printer. I expect it should be, like a Canon BJ-200 I guess would work. Also the number I tried to call from BobTerm was not answering, but it did act upon it. I think it works, just need the right equipment, like a DOS compatible, preferably Epson FX compatible printer, and a standard modem.

I put my 800 onto my oscilloscope to check for ringing on the joystick outputs. I wrote a little basic program that just toggles the output pins on and off for either port. With the 10x probe I saw no evidence whatsoever of any ringing, either with the output pins terminated to pin 7 +5, ground or floating.

I looked down to the highest resolution my scope offers (its a generic 20mc model, but the signal was clear down to 500ns/div. The rising edge is a little slow (forgot to characterize it, sorry...), and terminating with 10k to pin 7 +5 introduces a few tenths of a volt offset on the logic 0 side for both ports, but no ringing whatsoever. The trailing edges were uniformly clean and very much faster than the rising edge, < 1/10th the time more or less- corroborating your statement above.

I've often seen formerly clean edges messed up by long cable runs- could that have been a cause, or maybe overloading the pin 7 +5 with circuitry? (the docs say a max of 50ma load) Or maybe the slow rising edge was causing multiple triggers?

There were many brands of CP/M computers, and each required a different boot disk. Since you crossposted to so many newsgroups, there is no way of knowing exactly what you need. What type of computer is it? If it's an Apple II, what is the brand of CP/M card? If there is a newsgroup dedicated to your computer brand, post there or in comp.os.cpm.

Is trackball mode similar to the Atari St mouse mode?

meaning when I connect an Atari ST mouse to the Atari 8bit computer does it
work in track ball mode?

Strange you have problems like this. I have a little device here that
connects to J/S port 2 on XL/XE and port 4 on 800. combined with a
custom os, it connects to a printer. I must state that the 600/800XL
required a modifaction to both power and ground lines to the J/S
ports. A wire jumper across the power and ground inductors to the J/S
ports did the trick.
This interface is called Superface and the custom os was called
Printmon. worked very well. it uses a 74LS164 and a 74LS14.

That's too bad they had to ruin that one!
Atari is a ghost, and Hasbro is floating about scaring people.

PSX and PC? Could they pick two worse systems? NO.
How about Mac and Atari Jaguar? That would be an improvement.

Perhaps no one sees the element of inferior innovation in the current Atari name...

In the Windows version, you can even print to a PostScript printer (texts only, not graphics), and choose the font to use with this printer. So, if you have a TrueType font with the Atari character set look, you can print like it appears in the screen... what do you think?

I've been transfering files from my Mac to my 8-bit via null modem cable and have not had much luck getting any files with a .com extension to function properly on my 8-bit. I am using 850 Express on my Atari and the communications program in AppleWorks 5 on the Mac.

It seems odd, because any program I transfer with a .exe or .bas seem to work just fine.

Let me know if you have any suggestions.

Thanks,
Pete

In other words, it's more like a microcontroller... which are also
as difficult (or easy, depending on your experience) to program
as a microprocessor.

Just a guess, I am kind of sentimental about my 800 since it is one of the
original processor type MB and I have a 65C02 in it. I am not normal when it
comes to that machine, I won't even use it.<grin>

I am guessing that the first two JS on an 800 will be electrically identical
to an 800XL but the 3&4 J/S will produce different results. You may need a
scope to check switching characteristics, but I would guess the forward
voltage drop of the transistors in the active drive of PORT B will mean ~.6V
lower output voltage relative to PORT A and will provide a serious amount of
drive current. I think David Small's first Atari effort was a 10 meg Corvus
hard drive hooked up through J/S 3&4 on an 800. Could have been someone
else, but I think it was him.

Short cable, less then a foot. Could be hard switching of the ttl logic
glitching, hysterisis is the wrong term here but I can't think of a good
one. That is, slow rise because of passive pull up/inline caps and resistors
causing a long interval in the 'undefined zone' with ttl logic oscillating
from hard switching glitching the power supply.

I did some more reading last night, reviewing the properties of LS semiconductors. The graph of the transfer function of an LS family gate shows the output's transition from one state to another spans several 10ths of a volt of the input, ranging from about 1 to about 1.5 at average temperatures. If an input signal jitters within that range, it could cause multiple state changes in the gate's output- or the consequent slow output edges might cause other problems in downstream circuitry. In comparison, CMOS is shown to have a much narrower transition band, essentially instantaneous at the graph's resolution- this would tend to make it somewhat less sensitive to slow/jittery signals. Further, the faster output switching even given a slow input signal should also help prevent downstream problems.

Further, upon reflecting on the slow risetime of the joystick outputs, it looks as if the dv/dt of the signal is starting to slow down near the transition region of the LS gate- reducing the the traversal rate of the input signal thru the gate's switching band even further. If HCT logic were used to interface with the joystick port, output transitions would occur at lower input voltages where the joystick drive dv/dt is faster- hopefully reducing the liklihood of false triggering somewhat more.

The LS family does consume an several orders of magnitude more input current than CMOS, but it amounts to only 1 ma or so. I think loading issues from small number of LS gates can be disregarded as a potential cause of the trouble.

OK, I think Greg has switched me from suspecting it is ringing due to the
protection circuits to noise generated by the ttl logic hard switching.
> This interface is called Superface and the custom os was called
> Printmon. worked very well. it uses a 74LS164 and a 74LS14.
OK, 74LS14 => hex Schmitt trigger. There was no need to add this particular
part to their design, whatever it was, unless they were seeing the same
problems as me with noise and false clock pulses. This type part has built
in hysterisis for cleaning up noisy signals, producing square wave from sin
wave type stuff. The power supply mods kind of give that impression too.

I am so convinced the false clock pulses statements I made were accurate
that I won't pull out my old hack, but I will say in all likelyhood I
attributed it to the wrong source. Glitched power vs glitched signal causes
spurious results.

Learn something new every day... well about every year or two now. If I revise any of my J/S hacks I will take what you have revealed about the Supra stuff into account and to heart.

Me being me, I will probably run the J/S devices off of a separate power supply vs add a 74LS14 and modify my computer though; I am kind of lazy that way.

Thanks for the info!

Oh well,
there are thousands of AMS files avaiable on many homepages and servers.
For example try the Umich archive, once there search for a subdir
"music" and then choose the subdir "AMS". You may also try other
homepages of course... there are also many players avaiable, for mono
(one pokey) and even stereo support (two pokeys)... greetings

Hello,
really it looks like no-one ever made a portation of AMS sounds and
players/editors to other platforms. But there are some converters for
AMS files avaiable, I found these three 1) AMS1 => AMS 2 converts older
AMS 1 files to newer AMS 2 files, 2) AMS => AMP converts AMS files to
Antic Music Player (AMP) files 3) AMS => MMS converts AMS files to Atari
ST MMS files (since I do not own any ST, I do not know MMS files)...

Maybe there exist more converters, since AMS files are not that
difficult to convert to other sound formats... Who writes the first MP3
converter (convert AMS => MP3) ?!? greetings - Andreas

I don't think we can make too many judgments from what we've seen so far.
Some of the screens looked pretty good to me.

>Atari is a ghost, and Hasbro is floating about scaring people.
>

While some of Hasbro's efforts have been greater than others, I'd say what
we've got (in the classic game area) is better than nothing, which is
practically what we got when Atari was still it's own company.

>PSX and PC? Could they pick two worse systems? NO.

That's only good business sence, going for the widest market.

>How about Mac and Atari Jaguar? That would be an improvement.

I agree but it'll never happen.

>
>Perhaps no one sees the element of inferior innovation in the current Atari
>name...
>
>

I think you're being just a little bit harsh on them. We've only seen
their first round of games. All developers get better the longer they're
at it. I say give the new "Atari" people a chance. I'd say they gave at
least an average initial effort. If we want to see improvement we really
need to support them. The more money Hasbro sees from Atari the more
resources they'll devote to future developments & the better they'll be.
Heck, considering void of Atari products over the last few years I'm happy
to be getting anything at all.
Peace,
JJH

>> Missle Commend is the only one I have found so far.

I don't know, I don't have an ST.
The Trak Balls are compatible with the 2600 VCS, 7800, and 8bit
computer line.

they have a 9 pin plug and a switch on the back "TB/JS" in the manual
the book says that "Trak Ball" mode works by hitting alt-T before
starting the game.

Always try the Umich archive first. You may also try polish homepages,
like Tight homepage, Taquart homepage, Karol Meciar homepage, etc.
But Umich is best when searching for AMS files and players... greets -
Andras

So the users manual for CSS's Black Box (copyright 1989!)
at http://www.nleaudio.com/css/products/BB_Docs.htm
mentions that a "soon to be released" of MyDos 4.60 will be supporting
48MB partitions. Did this ever happen? Or is MyDos 4.60 still soon to
be released after 11 years?

Having given up on constructing a working Xformer parallel cable, I am now trying my luck with the ProSys serial cable. I've followed the published schematics carefully, but so far have no better luck than with the Xformer cable. What can I be doing wrong? Can anyone post the expected voltages on the pins from a completed ProSys cable? Or give me a link to a site that has them? Thank you.

Carolyn

I have a friend who has an Atari ST and an external modem at 1200bps.
It has a 3.5 floppy drive but NO hard drive. He wants to connect to a
local Community Network which is text only. He has been told by that
public server that the ST will work. He needs a communication program,
naturally, but we are lost as to what program would work, and, where he
has no hard drive, does the comm. program work off the floppy?
We are sort of lost in Atari limbo since our understanding of Atari and
its basics is basically nill. He must also connect using VT100 which I
assume the communication program would have to support. Someone has
suggested Flash V1.60 but I can't find it anywhere.Another suggestion
was Teddy_Term V2.14.
Any help would be greatly appreciated.
Thanks in advance,

Leo

Message-ID: <87sssa$7o8$1@barcode.tesco.net>
Source record: 46622

Hello again, I have just bought a Rana 1000 from the USA to England, and cannot get it to work. I am using a UK 810 drive PSU, and when turned on, the drive spins the disk and goes to track 0, then to 39, all seems normal. When the computer is turned on, nothing happens at all and the drive does not spin. I have checked that all the chips are seated, and cannot see anyhting odd except that one socket on the drive board is empty. It is at the rear left of the board, viewed from the front.

Can anyone help? Is anyone aware of any reason why the Rana would not work with a PAL machine? I have also tried it with a NTSC machine, still with no success.

HELP PLEASE

Richard

I pulled out my Commadore Semi lit. If nothing else I found out the part
number of that tri port device was actually a 6525.

They didn't report the value for the passive pull up or say anything about
drive capability for the ports other then PORT B active push-pull. I can't
remember the exact amount of Atari added inline resistance, but I am pretty
sure it is 220-800 Ohms or so. I also seem to recall a PORT A J/S will only
source .3 mamp so that would mean something like ~10k resistance in between
the power supply and what you get out a JS. Could be I am thinking of
another pin like the trigger button. Sheesh it has been a long time. I guess
this is the reason for things like a Wheatstone Bridge.

They do rate the source capability of PORT B at 1 mamp at 1.5V, but seem to
skip the details about PORT A.

That sounds much like NMOS type stuff, weak pullups (a few tens of
microamps) & somewhat stronger pulldowns (but only a couple ma).

>
> They do rate the source capability of PORT B at 1 mamp at 1.5V, but seem to
> skip the details about PORT A.

The 8255 has port drive variations too, I forget the exact details,
but the old NMOS version has "hi current" pins capable of a few ma
source & sink.

Modern CMOS is so much easier to deal with, the HC & HCT families can
source & sink at least 20ma on each output pin with edge rates up into
20mc and higher. CD is nice because you can run it up to about 15
volts, though its not as fast.

The joystick output's slow risetime looked very much like an RC
charging- though the trailing edge was fast. Do you know the I/O
protection components of the joystick port circuits?

Source record: 46625

Lemme see.
You got the dip switches right?
Up is on, down is off for all four.
you want it to be drive 1, so switches 1 and 2 should be off (down).
switches 3 and 4 control the density.
you can try down, down for 3 and 4 with a single dens. disk in the drive.
up, up for 3 and 4 would be the dbl dens. setting, the drive should
automatically
sense single, enhanced, dbl then. But testing with drive set single on a
sngl
dens disk should be the most likely way to successfully boot a drive that
may be 'marginal' or so.
There is a diagnostics mode.
Oh, poop. I'm not gonna edit. Double dens. setting is 3 off 4 on, not
3 and 4 on. 3 and 4 on is the diagnostics mode.
there are 10 self 'diagnostics'.
you select a diagnostic by pushing the UNIT ID pad.
once selected, push the TRACK pad to execute the function.

push the UNIT ID once and you should see F0 on the display.
push it again and see F1, etc. Push UNIT ID and execute the diagnostic.

F0 format disk single
F1 format disk enhanced
F2 format disk double
C0 Select LO (single) dens diagnosis
C1 Select enhanced dens diagnosis
C2 select HI (dble) dens diag.
d1 diag. sequential read
d2 diag. random read
d3 diag. write/read/verify (destroys data on disk)
d4 diag. random write/read/verify (d3 is sequetial)

Then there are error codes, etc.

Are you sure you're trying to boot with a good disk?

So the XE carts require the extra memory. It is not that they are XE
carts really but more that they are 64K carts, I take it.

Well, being a business with shareholders, I'm sure they'd like to make
money, eliminating the Jaguar. And besides market share, the Mac isn't
exactly known for its gaming prowess compared to a PC (don't start with
this one, advocates. Show me a Mac with a GeForce and I'll recant).

Hi folks,

Realizing this program is quite old, I'm hoping someone out there still has knowledge of this. I'm trying to get my ST to act as my hard drive for my Atari 8-bit computer. The program I have found is "800XL DeeJay" which is a cute little program that allows an 8-bit to access the ST via an SIO2PC cable.

Got the cable, the two computers, and I've tried various configurations, but still the 8-bit does not recognize the ST as a disk drive with the 800XL DeeJay program running. What are some things to keep in mind when trying to get this to work?

And if someone would be kind enough to walk me through this, my E-mail address is : drclu@swbell.net

Thanks!

You'll get no argument from me. In fact that's probably one of the
reasons *why* the PC has so much more market share - Apple's never even
really tried to get into the gaming scene, which is normally the main
reason home users by computers (oh, people say they buy them to do
their finances, or work from home, or use the internet, but I've seen
studies that show the majority of time people spend on their computers
is spent playing games).

And the Jaguar? They may as well release the game for the Sega Master
System or TurboGrafx 16. Sheesh.

Check out the Com-Port, in which you plug in the SIO2PC cable. Some ST computers (and especially Falcon computers !!) have to be modified to work properly with XLDeejay and SIO2PC. Since I do not own any ST/STE/TT/Falcon computers, I do not know which sort of modification has to be made... but wait, there was a TT user asking for a good XL emulator, maybe you can give him the XLDeejay...
And finally I hope there is anybody who can help with the XLDeejay problem (and modification) soon... greets - Andreas

I am posting this on behalf of soemone who doesn't have access to this
newsgroup:

I used to be an avid
Atari fan starting with my 400, then 800, and I now have stored away
two 800xl's, two 1050 disc drives, an original ST with external drive
and loads of software for all of it.

For personal reasons I no longer have the space for it and am loathe
to throw it out :-(

Do you know anyone who would like to take it off my hands for free??

Of course they'd have to collect.

Please reply to p.mcroy@zetnet.co.uk

No, SpartaDos never broke the 16Meg limit - 65536 sectors of 256 bytes each.
Any new DOS would realistically have to support Sparta and Atari/MyDOS and
then provide a way to have its own extended structure.

Not impossible, but I don't realistically see such a thing - who will put
the time into doing it?

David P.

It sounds like you would like the ProSys cable, which would allow you to
hook your disk drive directly to your PC.

> Additional questions: given my desired task(s), what will the

A couple of thoughts and observations:

Do you have another drive that does
boot successfully from the computer(s)
that you are using? It really sounds as if
the Rana is not receiving any commands from
the computer. Does the drive LED's show
any error code after you have attempted to
boot from it? Are there any wierd sounds
from the computer or speaker? Any
error messages on the screen? Switch the
SIO cable from one SIO port to the other
on the Rana. Do you know that the cable
is good? I saw the message from Russ G.
with good info about the dip switches, so you
have presumably verified that the dips are
properly set. The empty IC socket doesn't
sound good. I just took one of my Rana's
apart, and there are no empty sockets. Of
course, you could have a different board
version. Can you be more specific about
the location of the empty socket? What
are the distances from the on/off switch
at the left rear of the drive. How many pins
positions does the socket have? I have
a Rana tech manual, so perhaps I can identify
the IC if you can zero in on its location.

> Or is MyDos 4.60 still soon to
>be released after 11 years?

Never is a long time, but it's probably accurate. On the other hand, with all
of the partitions that the BB provides
(96 or so) at 16 meg each, no one should run
out of space. Doesn't Sparta X provide more
the 16 MB per drive/partition? One little
trick that I learned is to make all partitions
the same size. I make all mine 60,000 sectors,
which is a little over 15 MB. That makes using
multiple partitions much easier, especially if
you are using removable media such as Zip.

Hi Steve, The portfolio has basic apps built in. Better ones can
be downloaded.

You can find apps at many FTP sites. www.umich.edu has a
portfolio section (http://www.umich.edu/~archive/).

I have a few help files on the portfolio at my site:
http://people.delphi.com/rldetlefsen/atari/info/infomain.htm.
I am working on a list of files in my library, about 35 megs,
that should be posted soon, in the vendors area.

Cables let you connect to other computers. Cards lets you keep
apps portable.

Hope this gets you started.

Rick D.

Hi Pete, my first suggestion is to make sure that you are using
plain binary transfer, not smart Mac binary, etc.

And it depends on the .COM file. It may not be a standalone
program. Usually they are a DOS(i.e. SpartaDos) command
extension.

That depends on the program stored in the cart. some require less then
64K ram. some will work on an 800.
It is possiable for XE carts to have any size rom from 8K to 128K.
As far as I am aware, 128K rom is the largest XE cart around.

Click for WebSite!

(Update: 02/10/2000) I've just added more to my ST Software Catalog and
I've added considerably more to my Hardware Catalog for the Classic 8
Bit as well as adjusted prices in that Catalog. Their are some items in
my 8 Bit Hardware Catalog I've just added on a trial basis. If I can't
sell them, I'll get rid of them to make room for more stock. These
Items are mainly the ones marked AS-IS or untested.

e-mail: atari@benjamin.net

I've added more and will be adding more Hardware, Software, Books and
Accessories for Classic 8 Bit and Atari ST. So checkout what's new on
my WebSite. In Fact, check it regularly as my Catalogs are updated
regularly. Customer's are served, first come, first serve! I have 6
different Catalogs, and my SoftWare Catalogs are my largest. They have
the biggest Byte Count. You should see my inventory! I have TruckLoads
of HardWare, Boxes & Boxes of Software & Libraries of Books & Reference
Material for the Classic Atari 8 Bit & Atari ST! And remember, if you
can't come see me today, come see me tomorrow!

also, if you live in Portland, Oregon, interested in Atari and want to
meet with other Atarians. Read the Ad near the bottom of this message.

FREE Catalogs for Classic Atari 8 Bit & Atari ST Computers! Hard-
Ware, SoftWare, Books & Accessories! View Atari Catalogs on the Web at
http://www.atari.benjamin.net And Jump to my FTP site linked to my Web
Site so you can Download Free Catalogs or FTP directly to my site at:
ftp.teleport.com/vendors/bensmith/ If you can't get Catalogs that way,
Feel free to Request catalogs through E-Mail. Really, it's not an
inconvenience. I do ask that you specify Atari 8 Bit, Atari ST or Both!
Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail.
Please let me know if I can attach text files to your E-Mail. Catalogs
are just regular ASCII text files so you can download them into your
text editor and view them, edit them or print them out! It would make
things easier for me if you take my Catalogs, load them into your text
editor, delete what you don't want and E-Mail me the rest! To expedite
things, include your complete Mailing address so I can figure your
Shipping/Postage & Handling. I'll be back after the weekend.

If you have an Atari and live in Portland, Oregon. U.S.A. or vicinity, you are cordially invited to attend a Meeting of the Portland Atari Club. You don't have to be a member to attend. Now we've moved our meeting to a new night. Same Bat Time! Same Bat Channel! We meet the 2nd Thursday of each Month. Our Next meeting will be Thursday, March 9th, 7 pm at the Pizza Baron at 2604 S.E 122nd Avenue in Portland, Oregon. We're trying to rebuild our club so we're looking for Atarians who wan't to get involved in supporting other Atarians. If your interested, call Ben at (503)256-9974 and by all means, come to our meetings on the 2nd Thursday of the Month. For more info, surf the Web@

http://pac.pdxweb.net

e-mail: atari@benjamin.net

For more information or directions, please call our Vice President Ben Smith at (503)256-9974 See you there!

1142. ProSys Cable

Newsgroup: comp.sys.atari.8bit
Date: 2000-02-11 00:00:00 UTC
From: Stephen Knox <gooch@erols.com>
Message-ID: <38A40A84.DCDFBACA@erols.com>
Source record: 46653

Ok,

Now Im intriged. With APE and the ProSys cable can I direcetly hook my 1050
up to my PC and do file transfers from the PC->1050? Not just .atr transfers
but individual file from an .atr to a 1050 disk(and vs versa)?

Im also interested in moving files from a .atr to 3 1/2 floppies on the 8bit?

Can APE handle all of the above?

I have a SIO2PC cable but hate having to bring the 800XL up to the PC to run
it (and work blindly on the keyboard since no TV is around to view the 800XL
screen!)

Thanks,.
Steve

That does seem a bit strange.

I recently transferred pretty much my _entire_ 8-bit collection to my Atari Falcon via null modem cable. I didn't seem to have any trouble with specific file extensions though. However, I used BobTerm on the 8-bit side, as I could never get Express to function with a null modem cable.

You might want to give BobTerm a try, as it works very well, and can even translate ATASCII to ASCII during the transfer (for any text files you want to be able to read more easily on your Mac).

If you can't find BobTerm, e-mail me and I'll send you a copy.

Body handling: Binary attachment payload not displayed: vcard.vcf

If I remember correctly, joystick mode emulated the
digital codes of a real joystick, and trackball mode
emulated the paddles. I think the paddles were able to
provide values between 0-255, so the trackball was able
to do the same, giving a finer level of control.

The trackball in trackball mode will not work on an ST.
There is a modification for the Atari trackball which would
allow it to work with the ST. I did it and still have
the trackball.

>And the Jaguar? They may as well release the game for the Sega Master
>System or TurboGrafx 16. Sheesh.

Yeah, that 32-bit PlayStation makes much better errors than the 64-bit
Jaguar. Sheesh, indeed!

Must I also remind everyone that Wolfenstien was a precursor to Doom? Doom
was the first 3-D game on IBM. Wolfenstien was the first 3-D game on Mac.
Which was innovative? Whose chasing whose tail? My Mac LC, wich is over ten
years old, outperforms the fairly NEW IBM we have. It is not subject to the
viruses that chase IBM exe files, Mac doesn't have exe files. It can save
files using a space bar, *laughing* and it can read IBM discs without
emulation. IBM can't do these things. In a comparison, for some odd reason,
I can boot up my Mac LC, load up the web browser, hit my e-mail and then see
that IBM has finished booting up in the same amount of time. Yet, IBM users
always tell me Mac is slow. *laughs* Yep, and after ten years, IBM is still
catching up.

Besides saying that games never used to be about money, I will say no more.

With meddlesome charm,
MegaData

Now we are TOTALLY off-topic, but what the heck. I'm not a Mac hater or
anything but you did make some incorrect statements:
It's true Wolfenstein (the original) did come out for the Mac, but it was
NOT 3D. Wolfenstein 3D came out for the PC before DOOM did. Wolfenstein does
not equal Wolfenstein 3D.

1153. Aligning 810s or 1050s

Newsgroup: comp.sys.atari.8bit
Date: 2000-02-12 00:00:00 UTC
From: Dan Vernon <danver@safeco.com>
Message-ID: <883v8ohvk1@brokaw.wa.com>
Source record: 46664

I'm suspecting alignment problems with several of my drives, and I expect this would be a concern of anyone who uses their Atari regularly. Is there a way to properly align the drives without spending a fortune on special tools?

I notice that B&C Computervisions has something called an "ALIGN DISK 5.25 OSCOPE" for $25. I'm guessing its an oscilliscope for aligning floppy drives... does anyone know if this is a useful item, and if any software/instructions exist for aligning drives?

Thanks!
-Dan

1154. Wanted: valForth Extensions

Newsgroup: comp.sys.atari.8bit
Date: 2000-02-12 00:00:00 UTC
From: Dan Vernon <danver@safeco.com>
Message-ID: <88408i$k0i$1@brokaw.wa.com>
Source record: 46665

I'm sinking deeper into Forth these days and would really like to upgrade the editor in my valForth package. I know they had several extensions that were available in the early 80s, such as the editor/utilities package, pm graphics, display lists, text compression, and I believe a valForth target compiler.

I really want the better editor with the larger line buffer and enhanced screen copier, but I'm also interested in the other extensions as well.

Does anyone have any of these and would consider trading/selling/copying?

I have a number of comparable Atari dev tools currently for trade:
Action
Basic XE
MAC/65
OmniView XE 80 col. hardware upgrade
????

Thanks!
Dan

1156. Indus GT and Rana Diskdrives

Newsgroup: comp.sys.atari.8bit
Date: 2000-02-12 00:00:00 UTC
From: carmel_andrews@my-deja.com
Message-ID: <884c4l$fb9$1@nnrp1.deja.com>
Source record: 46667

Hi/hello Atari fans, I have a question regarding those obscure american 3rd party atari 8bit compat. d/d's, namely the Indus and Rana d/d's, as I have an indus GT, which i use in the UK

I seem to remember hearing or reading that the indus and rana d/d's actually were designed by the same people/family, and apparently there was some argument about the future direction of the existing product, and half the family left to set up a rival diskdrive co.. based on the existing tech...

Anyone out the who can substansiate this, or can shed any new light on this story, is it true.... only you out there in atari cyberland can tell me, also I would be interested in what happened to Atari's sierra computer (which was atari's attempt at either co processor tech.. (8086/6502 etc) or combining atari standard with ibm standard (s/w and h/w compatability) I remember some atari commentator making a snide remark by saying that it was the only worthwhile contrbution made by warners last atari president before tramiel took over(and screwed atari) I would also like to know what happened to dataques/charles steinmanns attemts with the 65816 based turbo 816 u/g and also the 3rd party atari compat. machine he was hoping to bring to market, some of which were based on turbo 816 as i remember

Keep the ATARI faith

Updated as of 02/12/00
New Items Added

I have a limited amount of brand new Atari Jaguar items for sale or trade. These packages are ideal for new collector's or somebody wanting to start or add to their Atari collection. If you have any questions, please feel free to ask. I am also willing to trade for certain items, please see my list at the end of this post. All prices quoted are in U.S. funds with the buyer paying shipping.

If you are interested in any of these items, please respond to me by using this automated link jim_l@NOSPAM.telusplanet.net?subject=Classics.Atari.Jaguar (removing the NOSPAM first). Or email me if you would like a current listing of items I have for other systems (Atari 2600/5200/7800/Jaguar, Colecovision, Intellivision, Classic Computers (Vic 20/C64/ADAM/Atari), Vectrex, Microvision, or Handheld games) sent to you, (please specify system).

** Atari Jaguar Packages - Brand New (all contain one controller, RF Box and AC adapter)**
==========
-.Atari Jaguar with CyberMorph cartridge and Composite Video Cable $50
- Atari Jaguar with CyberMorph cartridge $40
- Atari Jaguar (No Cart) $30

** Atari Jaguar Accessories - New**
==========
- Composite Video Cable $15
- Spare Controller $15
- AC Power Supply $15
- RF Switch Box $10

** Atari Jaguar Games - New/Shrink-wrapped**
==========
- Checkered Flag $10
- CyberMorph $5 (No Box)

Atari Force Comics Please make an offer
==========
All are in Mint Condition
- Issue #2 - February 84
- Issue #3 - March 84
- Issue #11 - November 84

Trades
==========
I am also willing to trade for rare or shrink-wrapped/sealed titles for...
- Intellivision, Colecovision, Vectrex or various Atari systems
- Shrink-wrapped Intellivision NHL Hockey or PGA Golf
- Shrink-wrapped or mint SEARS Telegames for the Intellivision
- Shrink-wrapped or mint DigiPlay games for the Intellivision
- Shrink-wrapped or mint Intellivision Tutankhman, Super Cobra or Popeye
- Intellivision Congo Bongo, Draughts, Triple Challenge and Fathom
- Rarer Mattel and Coleco Handhelds (a list is available upon request).
- A complete brown variation of the Intellivision ECS
- A World Book Tutorvision (Intellivision III Clone)
- A complete Atari Jaguar CD Unit or Jaguar Accessories
- Atari Jaguar Games (Most titles)
- A working Vectrex controller
- A working SONY SAT-A50 DSS Satellite Receiver
- Working DSS H or HU Cards
- And of course the ever popular, original Intellivision keyboard (should I be so lucky :).

My original question was about Missle Command.

By switching the trakball to TB mode and hitting control-T on the
keyboard Missle Command works in "Trak Ball" mode. Where there any
other games for the 8bits that used the control-T feature?

Wow, I just checked this post and no answers, turned my back once, and there you are!

I have already built the ProSys cable (it is similar to the SIO2PC cable), carefully following the instructions according to Stephen Tucker and also those of Clarence Dyson (with detailed schematics). I've tested it thoroughly for continuity. Everything checks out OK, but it won't work with my XF551 or with a borrowed 1050 for that matter. I thought at first the problem was that I couldn't locate a 14C89 CMOS and used a 1489 instead. But now I've swapped it for the correct chip, and it STILL DOESN'T WORK! Please, can anyone help me?

Carolyn

It probably wont work because you didn't use the cmos version
of the 1489. Most computers dont have enough current availble on the
control lines of the serial port to drive the more power hungry version
of the 1489.

This chip works fine in the APE/SIO2PC design because in that
design it is powered from the Atari's large 5v supply, and can soak up
as much current as it likes. On the ProSystem interface it is powered
from the control lines of the PC's RS232 ports, which supply only a tiny
amount of current.

I suggest you get a cmos version of the 1489, or add an external
power supply to your cable design. Since you already have a cable thats
probably well constructed, I suggest you try the external power
supply.

Just remove the zenier diode and attach a 5v+ source at pin 14,
and ground at pin 7. If the supply is unregulated or well over 5v+ you
will need the zenier or a 7805/7905 type voltage regulator. This type
of voltage regulator is super-cheap and can be had at radio shack.

Last time I bought a bunch they were like $0.20 each or less,
which means RS will charge about $2 for it :)

Steve

No, IIRC the trackball mode gives the same signals as an ordinary mouse/trackball - two pins for each of X and Y, one pin gives the direction (0 or 1) and the other indicates the speed by alternating between 0 and 1.

The problem often is that the SIO port just doesn't provide enough power.
I've found that certain drives--maybe even a majority of them--don't like
to coexist with SIO2PC on my 1mb XE. I know it's not good practice, but
boot your computer with only the disk drive connected and then disconnect
the drive and hook up your cable. If that works, then you can set up boot
software on the PC and only re-attach the drive when you need to access
real floppies. Needless to say, a large RAMdisk on the Atari would
facilitate transferring floppy contents to the PC.

> a way to properly align the drives without spending a fortune on special
> tools?

The only way to properly align a 810 drive is using a alignment disk with an
O-scope.
The alignment disk is a specially formatted disk that has a amplitude modulated
signal on
track 0 and track 16. You would first position the disk on track 0 and adjust
the head position to
get maximum amplitude on the signal. Then move the head to track 16 and check
it there.
To do the check you apply pressure in both directions on the head to see if the
signal amplitude
increases at all. If when you move it in both directions the signal amplitude
drops, you know you
got good head alignment.

The 810's were prone to going out of alignment because of the method Atari
chose to seeking
track 0 (issuing track out commands for a certain period of time). I don't
know why they just
didn't leave the track 0 sensor on the drives. Probably to cut costs.

>
> I notice that B&C Computervisions has something called an "ALIGN DISK 5.25
> OSCOPE" for $25. I'm guessing its an oscilliscope for aligning floppy
> drives... does anyone know if this is a useful item, and if any
> software/instructions exist for aligning drives?

What that is is the 5 1/4" alignment disk. No o-scope is included. If you do
some searching, you
might be able to find a o-scope at a flea market or thrift shop. It took me
some years to find one, though.

When my 810 went out of alignment many years ago, I got daring and aligned it
with a regular disk.
When it was trying to read a disk, I put finger pressure on the head and was
able to get it to read. I took
a allen wrench, loosened the allen screw and made a slight adjustment to the
head (with it powered off so as
to not let the drive try and move the head while the screw is loose). I was
lucky enough to get it to work.

Try this at your own risk though. I can't take no responsibility.

Another thing to look for is head pressure. There's a spring that applies pressure down to the pressure pad
that pushes the disk against the head. To check it, with the drive door closed, use your index finger and lift up
on the spring while keeping your finger away from the head and pressure pad. If the pressure pad lifts up by
itself, then you need to adjust that. Usually trying to lift up on it (the part that the spring pushes down on) and
doing a tilt down movement (down on the head end and up on hinge end) can usually get it back into shape.

> and if any software/instructions exist for aligning drives?

There are some cartridges that Atari made for checking them out. B&C might have some of those. As far
as repair manuals, the is a 810 and a 1050 repair manuals. One published by Atari, the other published by
Howard W. Sams Publishing (the people who do TV/VCR Photofacts). Try looking in your local library
at the main branch and see if they carry the Sams Photofacts and if they have the Computer Facts. Check
with the people at the resource desk. They usually keep these in the reference section and are not available
for checkout (but that doesn't stop you from using the copier, know what I mean). Like for
me, the main branch in Denver, CO (near the state capital) has some of the Computer Facts for the 8 bit Atari's.
If your library doesn't, try the nearest large city. Usually the large cities have the budget to buy these.

B&C and Best Electronics also carry them. The Sams versions are good and also carry some troubleshooting
and alignment instructions (and very short basic program to help you with testing/troubleshooting). The Atari
one is really good for theory of operation and more detailed alignment/testing instructions and usually has information
to go with the test cartridge.

Again, only do this if you feel confident about doing it. I can't assume responsibility.

Hope this helps.

How aggravating, Carolyn. I hope you can get this thing to work. I
emailed the nice proprietors at www.myatari.com and they offer a
tested XFormer cable for $29.95. So I am getting that, because I have
a 486 that I think it will work well with.

Good luck!

Erm, Wolf was the first on the PC (and the first in 3d on the PC -
you're thinking of earlier 2d Wolfenstein games for the Mac), and both
Wolfenstein and Doom were made by Id. Which was innovative is a moot
question - they both were, and their lineage has been continued through
Quake, Q2 and now Q3.

> emulation. IBM can't do these things.

You mean, Microsoft Windows doesn't do these things (as a default, I
might add - they could be done). Let's not confuse software with
hardware, ok guy?

Boot-up time as an indicator of computer power or superiority is lame
and meaningless. How about a real benchmark of performance?

> Yep, and after ten years, IBM is still
> catching up.

Sure it is. Ok, off to play Unreal Tournament...

I had prepared a longer response to this posting, but as I got to the
last two paragraphcs, I realized that all of what you said made so
little sense, I didn't know where to go with it. What is your point
again? What's a "Motorola error"? Mac and IBM (nee PC) are
converging? Hasbro doesn't "deserve" Galaga, because you've talked to
them and made some sort of emotional determination?

What are you talking about?

She has the CMOS version now, still problems.

I am thinking of putting one together and swaping with her if she will let me. It has kind of peaked my curiousity now.

Just digging out from what seems like a 1/2 decade hiatus from soldering. Actually have a working soldering iron again, still need a few other requirements like VOM.

You could say there common since they came with every Atari 7800 sold.
In fact you can still buy them through Atari suppliers. I also remember
that these joysticks had some problems after awhile. I beleive Best
Electronics fixed the problem and know offers the upgrade parts.

I used to work at repairing & Modifying Atari 8-bit, mostly as a hobby for the local guys. I aquired quite a stash of Atari 8-bit parts over the years, most of it has been packed away since I moved here to the Tampa, FL area in 1996. If there is enough interest I might be will to do repairs. I collect Atari also as a hobby. I not to long ago aligned an 810 for a guy I met on eBay, found out he lived 10 minutes away. I have all the alignment disks and a good scope. Any Interest?

> this?

A simple (well, not so simple) getty command will set your PC's serial port
as a terminal server, so all you have to do is attach an Atari (Easiest
method: Use an APE/Sio2PC cable to connect, and use Ice-T with the
"Rverter" handler).

This works for me:
getty ttyS0 DT19200 vt102

of course you can put any other ttySx if you want. Set the Atari to
19.2kbps.

Wow.. I didn't think this place exist any more

I am a proud owner of an Atari 600 XL, bought over 15 years ago, and still think of it fondly. Alas, when I last turned it on one of the sound channels is faulty.

I am wondering ...

1) How can I repair it
2) What can I do with this machine today ?

Saiful

1189. FS: Atari 1020 Color Plotter, Epson MX80FT Printer, and more!

Source record: 46550

Hi,
I have the following items for sale:
-2 Macinotsh Pluses - one of them has a non working floppy drive, other than that it is in perfect condition and the other one has a bad picture tube (you have to let it warm up for 5 - 10 mins before it will come on), other than that, the second one also works perfectly. Both come with the original Mac Plus keyboard and mouse and the first one to get sold comes with a power cord (sorry I don't have 2) and some copies of system disks for the Plus. Any more questions, just e-mail me. You can see a pic of one of the Pluses (they both are actually very similar in condition) at:
http://members.aol.com/kjj58/MacPlus1.jpeg
I am asking $25 each for these plus shipping.
-Epson MX80FT Dot Matrix Printer - I have no clue if this printer works or not, I think it is for non-Apple computers anyway. It has not been tested whatsoever, so I can't guarantee anything. E-mail me if you have more questions. You can see pictures of it at:
http://members.aol.com/kjj58/EpsonMX80FT1.jpeg
http://members.aol.com/kjj58/EpsonMX80FT2.jpeg
http://members.aol.com/kjj58/EpsonMX80FT3.jpeg
I am asking $10 plus shipping.
-Atari 1020 Color Plotter Printer - this unit is also totally untested and it is for use with Atari's 8 bit computer series. This is for the printer only, no power adaptor, sorry. If you have any questions, e-mail me. You can see pictures of it at:
http://members.aol.com/kjj58/Atari10201.jpeg
http://members.aol.com/kjj58/Atari10202.jpeg
I am asking $5 plus shipping.
Thanks so much! I am flexible with the prices though if it comes down to a few dollars here or there.
-Matt

Actually, I don't think they came with all 7800's. I have a PAL 7800 and
they have a thumb type of controller with two different fire buttons. Awful
to control

First, I was about to write it's a 7800 controller...

I also have one of the 7800's with those super-cheapo thumb pads, but
I saw those sticks (from the picture) with some Atari consoles. Maybe
they were just too expensive to manufacture and so Atari went with the
cheap ones after a while.

1192. Anyone tried the Super Video Mod? I did.

Newsgroup: comp.sys.atari.8bit
Date: 2000-02-14 00:00:00 UTC
From: Brian Hutchinson <brian.hutchinson@ericsson.com>
Message-ID: <38A80535.498F95B5@ericsson.com>
Source record: 46553

Greetings,

I was just wondering if anyone has tried the Super Video mods on the XL/XE machines. I just did it to a 800XL and observed the following:

1. At http://members.delphi.com/lmcclure/svxl/SV20_800XL.htm Step 3 says to solder a 2.2 ohm resistor in parallel with the 51 ohm resistor that is already there.

2. At http://www.redshift.com/~cdyson/supervid2.html Step 3 says to remove the 51 ohm resistor and replace it with a 2.2 ohm resistor.

Which step is correct or does it make much of a difference?

When I went to make my S Video cable to hook up the 800XL to my Jam!!, I used
http://www.redshift.com/~cdyson/supervid.html and everything works great. Pay attention to the picture shown. The picture is of a female S Video plug (that is what is meant by "S-Video socket at the peripheral"). It was 2am when I made my cable and I didn't catch this and hooked up my cable backwards so don't be like me, study the picture!

Now I have a great picture on my 800XL. Now if I can get the 600XL and 130XE done I'll have my 8 bit collection up to date with S Video output!

Regards,

Brian

1193. 8bit Cable TV Char. Generator

Newsgroup: comp.sys.atari.8bit

Hello !

Thanx for the interest, but the thing is finished.
There won`t be any second edition because of a number of different reasons.

Maybe, we will publish a scematic (if we have one - this one was layouted
with scematic in mind only) and drivers (at the moment without any comment
and even I have great problems understanding it).

So if you want to have an IDE-interface try to get Atari Classics, Bob had
published plans for a simple, working
interface (but 8 bit only, so no trough CD-ROM support possible).

Sorry, but that is the situation at the moment.

Matt

1195. RS232 cable pinouts! 850-modem

Newsgroup: comp.sys.atari.8bit
Date: 2000-02-14 00:00:00 UTC
From: Heavy G <heavyg@evcom.net>
Message-ID: <38A87B15.F8F0902D@evcom.net>
Source record: 46556

Does anyone have the pinouts to make a modem cable for an 850? or know a site that has it? I been looking, and I used to have a text file showing them but lost it.

1196. FS: Atari books and magazines - bundle for $20

Newsgroup: comp.sys.atari.8bit
Date: 2000-02-14 00:00:00 UTC
From: bilstein@alumni.utexas.net
Message-ID: <38a87296.14382990@news-server>
Source record: 46557
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st

I have the following books and magazines for sale as a bundle. You can see pictures here:

http://www.geocities.com/TimesSquare/Arena/3336/ataribooks1.jpg
http://www.geocities.com/TimesSquare/Arena/3336/ataribooks2jpg

Take everything for $20 plus shipping (will ship book rate if you want). US shipping addresses only please.

All are in pretty good condition, nothing has any seriously tears or blemishes, just some average light wear. I don't believe there are any missing pages, although I didn't comb through each item, so they are being sold as-is. Here are the titles:

BOOKS:

- Your Atari Computer: A Guide to Atari 400/800 Computers, by Lon Poole with Martin McNiff & Steven Cook, 458 pgs
- The Atari Assembler, by Don Inman and Kurt Inman, 270 pgs
- Hands-On BASIC for the Atari 400/800/1200XL, by Herbert Peckham, 304 pgs
- Atari BASIC, by Bob Albrecht, LeRoy Finkel, & Jerald R. Brown, 332 pgs
- Stimulating Simulations, by C.W. Engel, 100 pgs (12 BASIC programs, not specifically Atari)

MAGAZINES AND BROCHURES:

- Atari Explorer: 10 issues: Winter '86, Summer '87, Spring '87, November/December '87, March/April '88, May/June '88, July/August '88, March/April '89, September/October '89, January/February 91.
- The Atari Connection: 4 issues: Welcome Edition, Vol. 1 No. 2, 3, 4.
- An Atari 8-bit Extra from Analog Computing, Summer 1987. Slick cover 130 pgs.
- Computer Entertainment, August 1985. Lots of Atari gaming info.
- Compute! Magazine, Vol. 8, No.2 & Vol. 9, No. 9. '86 and '87, both feature articles on Atari.
- Personal Computing Magazine: 7 issues. Dec '85, May '86-August '86. These are mostly IBM oriented, but I thought I'd throw them in here.
- Atari Personal Computer Product Catalog, 1981, 29 pgs
- Atari Program Exchange, Software Catalog Fall Edition - 1981, 40 pgs

Finally, there is a packet of brochures from various companies offering Atari products. There is an accompanying form letter from Sally Bowman of Time Warner/Atari stating that they have sent these brochures to Atari 400/800 owners as a service to them. It's just a

form letter, but it's still pretty cool, and has the embossed Atari letterhead on it. The brochures are from the following companies: The Source, Creative Computing, Analog Magazine, Quality Hardware, Compumax, Compute!, Custom Electronics Inc, Dorsett Educational Systems Inc, Houston Instrument, Innovision, Kurta Corporation, Macrotronics, The Casemaker, Personal Software Inc, Peripherals Plus, and United Software of America.

You could use it as a doorstop.

Just kidding !!!!!

My guess is that you could buy a replacement far cheaper than repairing your computer.

Even though I do most of my computing/web surfing on an IBM based unit, I still have my 800XL hooked up and use it for a variety of applications. Basically, I still use it for the things I used it for in 1985.

I haven't done the mod, but since the 2.2 ohm resistor is more than 10 times
smaller than the 51, it shouldn't make much difference if any at all.

I'm interested in this answer, as well. They used Atari 8-bits as announcement boards in at least one dining hall at Syracuse while I attended, and until they were swallowed by Gates Inc, the local cable company used what appeared to be the same program. There were times when they were actually airing an editing session.

John Harris of Frogger and Jawbreaker fame was producing and selling such systems. I don't have a current Email for him, but he has been known to lurk here is csa8 from time to time.

Since I didn't get any trade offers including anything I really needed,
I decided to put this system up for auction. I will still entertain
trade offers of 2600 and NES carts, though and will end the auction
early if something really catches my eye.

I seem to recall that Pab Sungenis wrote a basic program to display just such an information screen for a cable station he was working for at the time. MBoard2000 I think it was called, that did almost the same things you're describing. I'm betting there's a copy of it floating around Umich or one of the other archive sites.

>emulation. IBM can't do these things. In a comparison, for some odd reason,

Ummmmm...huh? Granted, a Mac can do it out of the box for
floppies. Something like MacDrice98 works well with a PC under Windoze in
accessing numerous drive/media types. But there are also installable file
systems (Mac HFS) for "real" OSes, ala OS/2 and Linux. or you could also
"resort" to OSS emulation. Executable virii were eclipsed by M$ virii
eons ago. Trojans are another issue.

I have an Atari 130 XE that was apparently modified and
re-sold as such a system. The label on the bottom of
the system was replaced with one saying "Control and
Information Systems Inc" along with a serial #. Inside
it is a very new 130 board that has only 4 64x4 Memory
chips instead of the usual 16 64x1 Chips. The cartridge
port has been removed and re-soldered in place so that
it points straight up into the case. In this port there
is a modified cartridge board that fits inside the case.
Th board has 2 256K eproms and a clock chip on it as
well as several jumper wires etc. It also appears that
some of the components around the video socket have been
re-soldered so it may have a video upgrade as well (the
picture IS very good).

When the system is booted it comes up to a package titled
GraphTech Systems. This appears to be a very extensive package
allowing for editing text, saving to disk, reading from disk
changing font sizes colors, smooth scrolling etc. etc. etc. .
It has a complete online help system and actually is quite
impressive. The clock chip is still keeping time (I have never
set it and it was less than an hour off) but does have a Y2K bug
(It thought today (monday) was Sunday).

Because of the way the cartride is modified to fit the case I
have been unable to try it in any other 8-bit system so I don't
know if it makes use of the extra memory in the 130XE but I'd
bet it does.

>Yes it does.

Not without an IBM emulator to run ".exe" and ".zip" files. Mac use hqx,
sit, and sea files. Generally, you don't see these things on IBM
compatibles.

>> It can save
>> files using a space bar, *laughing* and it can read IBM discs without

>hardware, ok guy?

I was talking about Dos.
I think there are folders in Windows that are called "My Documents" and
other things that use a space bar... for folders. That's software, though.
You have to buy that, in some cases. Most IBMs come with Dos as standard
issue.

>> In a comparison, for some odd reason,

You mean like the Macs that are quoted at 500 Mhz need to be compared to an
IBM Compatible of at least 600 Mhz? (Clone inconsistencies may vary.)

>> Yep, and after ten years, IBM is still
>> catching up.
>
>Sure it is. Ok, off to play Unreal Tournament...

Don't play StarCraft. You'll probably never be able to complete a networked
game. Well, maybe once a week... if you play every day.

Are they networking Galaga? There's an interesting concept... well, not on the machines Hasbro chose. On Atari Jaguar would be cool. Voice Modem would be prefered. Stereo sound is a must. Can't PlayStation any of the words. You have to utilize every aspect of Jaguar's networking capabilities and make use of those CatBoxes. Nah, it's too big a task for Hasbro. They couldn't make a 790 MB Jaguar CD with Voice Modem Networking capability with up to 32 players and Stereo Sound. They just aren't up to the challenge. They remake games. They don't improve them. They'll do what everyone else is doing to "update" them. That's what Hasbro does. Nothing creative. No doubt Hasbro will fail raise the bar.

Hello Jim,
since this harddisk-interface was made in Germany, it has a german
manual :-) It supports IDE/EIDE harddisks (up to 240 partitions of max.
16 MB MyDos/SpartaDOS capacity), single+double+quad speed CD Rom (max.
is about 20x CD ROM), ZIP-Drives (OEM versions) and maybe other things.
It was once sold for about 120DM, which are nearly equal to 60
US-Dollars. It was made for the parallel bus, thus you needed any XL
computer. Nowadays this interface is completely sold out and it is not
produced any longer... greets - Andreas

P.S.: If you still need a harddisk interface you should buy
a black box or an XE-interface from poland (sorry no infos about that).
Maybe they support CD-ROM as well...

Source record: 46575

[snip] ...some XE carts need 64k memory (Ram under OS ROM)...

> That depends on the program stored in the cart. some require less then 64K ram. some will work on an 800. It is possiable for XE carts to have any size rom from 8K to 128K. As far as I am aware, 128K rom is the largest XE cart around. James B

Hello James,
yes thats true. But 128k is not the largest size thats possible.
You can have up to 256 (!) "banks" of 16k (via bankswitching). That would be 4 megabyte, but since we need some program management for doing the bank switching it will be less than 4MB, let`s say something in between 2 and 4MB (theoretically). Conclusion: Any XL/XE game could be brought to a cart, even Alternate Reality and many others - if there are hackers and patchers that redesign or reprogram a game in such a way, so it works from a cart...
Any volunteers out there, for moving both A.R. games onto a cart ?!?
greetings - Andreas Magenheimer

Hello David,
some guys from Poland are trying to do that by now. If I am correct,
they are writing a DOS thats Sparta compatible, but able to use 512
bytes or even 1024 bytes per sector (harddisk only). that would be 32Mb
per partition or 64Mb per partition... A Long long time ago (quoting
American Pie) Atari developed quite unpopular DOS 3, it used 1k per
sector/block. Maybe there is a posibility to get DOS 3 working with a
harddisk and up to 65535 sectors/blocks (a 1kbyte).
Who knows, we will see what`s happening in Poland (sooner or later).
greetings - Andreas

I knew you were going to say that. Mac programs are executable files;
they are as vulnerable to virii as any other executable program.

No, I mean like running a benchmark (you know what that is, right?) on
two different systems, and comparing the results. It doesn't matter
what two machines you run them on, whether they're comparable or not -
that's the point of a benchmark, to find out which has superior
performance in that area.

Good, I'm not the only one that found this guy just plain weird. I was worried I might be offending some long-time member of the newsgroup or something - the guy displays his computing ignorance with every muttered word, doesn't he?

As much as I can remember, the Atari Portfolio was an attempt to create a hand held PC compatible computer, with a reduced screen size (80 columns wide, probably about 10 lines high). Maybe it can referred to as the first palm computer. The operating system is supposed to have the 'look and feel' of MS-DOS, and it may be software compatible as well, although I recall that modifications to software had to be made. Popular PC programs like Lotus 1-2-3 were available for this computer.

They've also started to file a couple of copyright infringement actions.

I'm not to sure I like this. I mean I am for protection of intellectual
property and all that, but I liked making the argument in the abstract i.e.
you shouldn't do it because it is wrong. "asbro will file a lawsuit if you
come out with a Pac Man clone"isn't nearly as much fun to debate.

Maybe I missed something here. Hasbro is filing lawsuits for pacman
clones?

Namco owns Pacman and Galaga. Why is Hasbro using their money
to defend Namco's property? Atari doesn't own either, maybe a license
but not own, that title belongs to Namco only.

It would be humorus if Hasbro released another updated Namco game like
"Ms. Pacman" only to be tapped on the shoulder by Namco wondering why
Hasbro believed they owned other popular Namco titles.

Other oddball things I wonder about is will Hasbro pacman stuff end up on
the
playstation? That would be dilution of tradmark that Namco enjoys on the
playstation. (It would be sweet to see two Giants battle royal over
something
like this rather than pick on the small fries. C'mon Namco, put the fear of
God
in one of those big corporate giants and stop picking on the small potatoes
arcade
collectors!)

Regards,
Sam Gladstone

I did say that 128k is the largest XE cart avilable. The XE cart has
that design limit. The xe cart also only switches the bottom 8k, The
upper 8k always stays where it is. Of course, poeple can design much
larger carts. There is nothing stopping you from having 65535 banks
in theroy.

blinks

Who uses IBM constructively?

grin

>Most PCs (stop with the "IBMs" already) come with Win32 as standard.
>Your computer knowledge is nil, it seems.

Thankfully, when it comes to IBM, I have no schooling. Well, that's not
entirely true... but I don't want to bore you. I've used Apple IIe, IBM,
Mac, Silicon graphics, NeXT... big deal. Yadda, yadda.

IBM, and their compatibles = PCs. No one ever calls Macs PCs. IBM clones can
be called IBMs. So, I won't stop. IBM is spelled just as long as PCs.

>performance in that area.

Right. *grin* That's funny!!! I thought you didn't want to talk about IBM
software. There is no reason to compare the slower operation speeds of a Mac
when they are so close to windows and windows programming bogs down the IBM
to speeds under that of a Mac. IBM also costs more to maintain system
software. If you want to spend that kind of money, fine. Have an IBM. Stop
putting them in schools. We pay for those megaliths. Certain programs are
minutes faster on Mac.

>> Don't play StarCraft. You'll probably never be able to complete a

>
>I have no idea what you're talking about.

You don't know what StarCraft is?

There are networks that crash in IBM that will mess with your screen, prevent dreams, and make you scream. IBM has more incompatibilities/errors than a Mac, like I said before. But realize that I'm talking about an older Mac compared to a new IBM. New computers are virtually compatible.

>Kook.

They apparently ARE networking Galaga.
I guess you don't care about the subject. I'll change it... done.
I like when I actually discuss the subject... how people react poorly. Makes you wonder why there aren't more Kooks, spooKs, and gooKs.

By the way. I mistyped before. I think it was Mac System 9 that should be playable on IBM, if the rumors are true. Mac and IBM will be one. You wait long enough, it'll happen.

IBM and Motorola destroyed Atari and Mac. All it took was a handshake.
Keep your friends close. Keep your enemies closer.
False friend or true enemy?

Okay, let me get this straight. Hasbro has been asleep in a cave because they've taken one of the most popular arcade games ever (one which continues to make operators money today), and created a new version of it for the most popular computing platform (Windows being on 90% of the world's computers), and the most popular gaming system, Playstation. Boy, someone should warn the stockholders because they're really going out on a limb here!

BTW - Playstation2 will play Playstation discs and a year from now, people will be saying "Whatcast"?

Now go away.

DOS still loads from disk if you set the cart flag for boot. I used the
SpeedScript cart I made with every DOS I had laying around. I actually made
two SpeedScript carts, one with no disk boot for when I just wanted to knock
off a quick letter w/o saving it.

I remember the problem being the minimum allocation unit was ~1024 bytes. So
if you had a short files, like 10 versions of ML program you are debugging,
it was possible to waste almost 20k for the 10 copies of source code and 10
.obj files.

Just my op, but in anything Atari storage you are going to do, you will have
this type of file storage problem. Specifically, most Atari files are 4-32k
in lenght, so even when you start talking 16 meg of storage per hard drive
partition you have to take the number of files into account.

I have to disagree here. Hasbro seems to be doing pretty good with their ownership of Atari so far. Have you tried some of their releases? Their Pong for IBM PC/compatibles is a roaring good time whether alone or against a friend (it even supports Internet play), and Atari Arcade Hits Volume 1 is a textbook example of how a classic arcade game compilation on personal computers should be done. I'm pleased with their efforts so far, and I look forward to their future products as well.

Would I like to see Galaga or some of these other games on the Jaguar? Sure I would. Unfortunately the Jaguar has been off of the mass market for nearly four years now. The voice modem only exists in prototype form; only a handful of people own one. It's not a matter of being too big a task for Hasbro--it's just that these other markets offer a much larger potential userbase. Also, many of these platforms offer hardware that is simply more powerful than the six-year-old Jaguar system, meaning that they can often get more impressive results with less effort.

Don't get me wrong, I think the Jaguar is a great machine. I still have mine hooked up, just as it has been since November 1993. I still play it frequently. I still support the developers who are bringing out new, quality software for the machine. But at the same time, I appreciate Hasbro's efforts to bring Atari games to a broader audience of gamers who happen to own other systems.

About four or five years ago, I read an interview with Nolan Bushnell where he made a remark along the lines of (not an exact quote here): "Software is

what really matters. Hardware is just something you buy to play software on." Think about it.

Mike,

If you're still looking for a good composite video monitor, I have a Sanyo DMC-5500 monitor available, complete with the connecting cable for your 8-bit Atari system. The monitor is in like-new condition and works perfectly. By the way, it also works great connected to a standard VCR for television output (using the VCR tuner). You can have it for $25 plus shipping (USA only). Shipping cost depends on location, so if you Email back your address, I can check with UPS on the shipping cost.

Again? One of the most popular errors? :-) Correct installation of
Windows uses DOS as a bootloader. Then it uses it for 16bit Win/DOS
programs.

People are brainwashed by advertising. I knew that. Your supporting evidence
of numbskullism eludes us. Because your friends jump off a bridge means, you
ask how many? If it's a high enough pile, you jump. Go ahead.

You doubt your strength or courage, don't come to join with me.

>Hi dork. You said you were talking about DOS, and I ask you: who uses DOS
anymore? Don't dodge it - answer it.

Hi guy.
One of my programming friends uses it. Microsoft uses it. I know people who
use it. What of it? I don't understand where this is supposed to lead us?
Suddenly Windows shouldn't offer an option of a dos screen? Do it! I'd like
to see user reaction. I'd like to see Ms-Windows without the Ms-Dos option.

>> Thankfully, when it comes to IBM, I have no schooling.
>
>Yeah, that was pretty apparent. So, why do you think you should be
>talking about it then? You are making a total fool of yourself.

I fail to see that. You are the one calling names, clipping out the
subsequent quotes, which answer the very questions you seek...

>> IBM, and their compatibles = PCs. No one ever calls Macs PCs. IBM clones
can
>> be called IBMs. So, I won't stop. IBM is spelled just as long as PCs.
>
>You'll be understood better if you call them PCs, which is the standard
>term. But if you don't care about being understood, and insist on using
>a non-standard term (remember, IBM makes a lot of things besides PCs),
>prepare to be misunderstood.

I was using the standard term. You are not. Personal Computer is a term
brewed by Atari.

>> >No, I mean like running a benchmark (you know what that is, right?) on
>> >two different systems, and comparing the results. It doesn't matter
>> >what two machines you run them on, whether they're comparable or not -

>>
>> Right. *grin* That's funny!!! I thought you didn't want to talk about IBM
>> software.
>
>Benchmarks gauge hardware, brainiac.

This is no time to indulge in clipping quotes that explained my sentence.
Here...
throw *bounce* *plop*
>> There is no reason to compare the slower operation speeds of a Mac
when they are so close to windows and windows programming bogs down the IBM
to speeds under that of a Mac. IBM also costs more to maintain system
software. If you want to spend that kind of money, fine. Have an IBM. Stop
putting them in schools. We pay for those megaliths. Certain programs are
minutes faster on Mac.

Now, who cares about hardware when software makes the system? No one gets
rich selling hardware, alone.

>> >> Don't play StarCraft. You'll probably never be able to complete a
>> networked
>> >> game. Well, maybe once a week... if you play every day.

>> >I have no idea what you're talking about.
>>
>> You don't know what StarCraft is?
>
>Play it all the time. I said I don't know what you're talking about -
>"never complete a networked game"?

You must get on-ine with only one other person?

My brother, who plays it constantly with multiple persons, has trouble with
the majority of his friends' computers. I was talking about incompatibility
issues among IBMs. They have no standards. They've always had an open
platform.

>> There are networks that crash in IBM that will mess with your screen,
>> prevent dreams, and make you scream. IBM has more
incompatibilities/errors
>> than a Mac, like I said before. But realize that I'm talking about an
older

>
>Your non-sequiters continue to pile high. I thought you said Motorola
>had "more errors" (more newbie terminology). Anyway, all of the above
>is nonsensical, again. Big surprise.

grin I like when people call me a newbie. Thanks. I look young for my age,
too.

PowerMac gave Mac more errors than previous Macs, not more than IBM has. Mac used to have complete control over it's hardware. For some time now, Mac has had clones. IBM has more inconsistencies without ever having a real standard, giving it more errors. (See StarCraft notes.) Apparently, Macs give you warnings with error codes when an error occurs, so that you can correct the problem or at least know what went wrong. I don't think I've ever seen that type of thing on an IBM machine. They just lock up, or go all weird on you. (Check out my vocab., dude. "all weird on you" could give you some great ammunition.)

>Why do I keep responding to you? I guess I can't stand not to have the
>last word. ;)

That's what I thought.

>> They apparently ARE networking Galaga.
>
>Great.

Yep, and since Hasbro bought everything else, (not an ounce of Hasbro in the game) they are building a space ship based on the game designs. They're going to send a team of astronauts into space to compete with networked Earthlings around the globe. It should be grand. Sign up now for your time slot. Win a free game.

>> I guess you don't care about the subject. I'll change it... done.
>> I like when I actually discuss the subject... how people react poorly.
Makes
>> you wonder why there aren't more Kooks, spooKs, and gooKs.
>
>The subject is fine, but your ignorance of it is so plain, it makes me
>wonder why you'd want to open your flap and reveal your foolishness.
>But, it's your life.

My ignorance? Hasbro is the one who said they want to develop for "next-generation machines," not I. They procaliamed superior games on seperior technology. It is their words which do no justice to the Atari name. Hasbro just is PSX, and not PSX2. Got it? Hasbro just is IBM, and not Mac. If they want a WIDE audience, they should choose more than two platforms... and some with standards.

>You are again confusing hardware with software. It doesn't matter if
>any Mac OS will run on a PC, it will still be a PC. You do know that
>you can run a variety of operating systems on a PC, don't you? None of
>them make it anything other than a PC.

So, you're saying some Mac clones are a PC. Now, I understand what you mean by "PC." That sounds correct, but now we'll be confused. I thought that's what you were trying to avoid by forcing me to use your definition of PC.

>> IBM and Motorola destroyed Atari and Mac. All it took was a handshake.
>> Keep your friends close. Keep your enemies closer.
>> False friend or true enemy?
>

>I get it now - you're a troll.

A man only sees what he wants to see...
Ride the barrel of innovation.
I'm definitely more than a man.

Yeapers. Can't remember who they are suing though, I was reading newsgroups when one of the national news services like CNN announced it. Almost positive it was two games and one of them was a Pac Man clone. The company they were suing I had never heard of before, but then I don't follow the game industry at all so essentially I haven't heard of anybody.

Not sure about the actual machinations, I think you are right about the Namco being the originator of the game, but I assume they sold certain rights to Atari for things like the home version vs arcade. IIRC, when you run an 8 bit Pac Man cart you do see a "Copyright 1979" or something around that time period on the screen. Can't remember if it was Copyright Namco or Atari off hand, but Atari definately had the rights to sole distributorship.

Because it makes you look ig-nant? Knock yourself out.

>They aren't going for Dreamcast. They're not going for Nuon. They're not
>shooting for PlayStation2. They are shooting for OLD market PC and
>PlayStation.

Strike 1.
"They aren't going for Dreamcast." I suppose that is the rationale behind releasing the Centipede remake for the Sega Dreamcast. Because they "aren't going for it".

Strike 2.
Frankly, no established developers are really going for NUON at this time. The point is moot.

Strike 3.
Come back after the PS2 is even launched in the USA. Unless of course you have scans of internal Hasbro Interactive memos re the cost/benefit ratio of PS1/PS2 development.

Please let us not delve into the Mac vs. PC battles again. It doesn't freaking matter -- you use what you want to for whatever reason. We don't care why you feel that way or who's actually "right"!

And, for the record, yes, PC stands for personal computer. It theoretically can be used to refer to any personal computer. But, you will only confuse people if you refer to anything but "IBM-compatible" computers. PC is the industry-accepted moniker for such, whether you like it or not. It's like "video" being used to refer to VHS only, even though video itself obviously can refer to anything visual encoding involving motion, including (but not limited to) Beta, 8mm, DVD, laser discs...there's another one: laser disc. This is used refer only to the large LP-sized discs, though DVD is also obviously a disc technology using lasers. Just listen to the ads: "Coming soon on video and DVD..."

Bingo! If more people understood this fact, there would be less
meaningless hardware advocacy. Me, I use whatever is the most powerful
and advanced at the time, and has the software to support it. Right
now, that means PC. In 1989, that meant Amiga. In 1982, that meant
Atari. The switches are actually very easy, and as long as the software
rocks, I don't much care what the platform is.

The whole idea that Hasbro is out of it because they aren't supporting
the Jaguar just gives me the giggles. They're bringing great updates to
our screens, and we're worried that they don't support a sentimental
favorite, that can't even do the things their updates do? Give me a
break....

not to claim this is ordinary... but...

Mike Kohary <mkohary@earthlink.net> wrote:
> You said you were talking about DOS, and I ask you: who the
> fuck uses DOS anymore?

I use DOS four days out of the week, being the days I work. The
company that employs me has a large suite of programs used by many
hospitals across the country. Currently the DOS product makes up
80-90% of our revenue stream, even though the legacy team is down
to just 8 people maintaining and enhancing the code. The Windows
products don't have the functionality of the DOS version yet, so
the company can't afford to shut down the DOS products any time soon.
In fact, unless something major happens, they won't even rethink the
status of the DOS products until 2004.

So, I, my 7 fellow legacy developers, the QA & interface & support
people still working with the DOS product, and the MANY users of the
product still use DOS.

It's not ordinary, so why pipe up about it? You know what I mean -
obviously it's not that literally *no one* uses DOS anymore. But this
kook made a crazy claim, was called on it, then claimed he was just
talking about DOS, a cheap excuse for a backtrack if I ever saw one.

Let's not get too semantically oriented here.

Well... if you had a RAMdisk you were probably thinking you wanted a
reboot without the necessity of reloading the RD. I used to do the same
thing with an old game cart to get a "locked up" 256k XL to reboot. Funny
thing was I could get a locked XE to boot by rapidly pressing the Reset
key several times but the same trick never worked on the XL.

Hi all.

I've put my Atari 800XL system up for auction on eBay. The need to
scrape together as much money as possible for our new house outweighs
my need to have the Atari around. :^(

There are two things unusual about this system:

1) The 800XL sports that somewhat rare matching two-tone power supply
(the one that Atari didn't backfill with epoxy)

2) It comes with BOTH an SIO2PC interface and a ProSystem interface
(quality built by yours truly). :^)

The auction's URL is:

http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=264289240

Thanks much,

Chris

> C64 carts, but never on Atari carts.

I know what it is! It allows you to simulate a cold-start
without turning off the power. Hold the button and press
RESET. It's just a glorified jumper, but it has its uses.
(?)

I did the same thing with a crappy game cart... hold RESET,
jam in the cart, release RESET. Why not just turn it off?
I wonder what I was thinking...

Oddly, it's the 400/800 that really needed this (RESET doesn't
really do anything, unlike the XL/XEs), but the cartridge door
would make it unusable.

1262. Memory Expansion Testing

I am looking for software that will perform
a complete test of Expanded memory on Atari
8-Bit computers. I have a 576K XE, a 256K
800XL and a 1200XL with a RAMBO XL 256K
expansion. They all seem to work but sometimes
flaky things happen when I access the extra memory
so I would like to get something that writes and
reads every byte of the memory and can point to
bad addresses. Any help in locating such software
would be appreciated.

Thanks
Boyd

No RAM disk, I just hated to use the power switch. I guess
because my only fried XL died on power-up. Superstition?

1264. A somewhat crazy idea

Newsgroup: comp.sys.atari.8bit
Date: 2000-02-19 00:00:00 UTC

Message-ID: <hfkpaso45hj83vg1cnltmnqocttqifn85l@4ax.com>
Source record: 46475

I was just thinking... with the A8 handling so many things
through device drivers/handlers, hasn't anyone thought yet
of writing a sound or music device, in the same fashion as
the Linux /dev/dsp , /dev/audio , /dev/midi , etc. ? I mean,
having a device handler would simplify enormously the task
of writing let's say a MIDI player or a WAV player (examples
of synthesized and sampled sound, respectively).
So, how do you like the idea?

I want to buy the following games, preferrably including box, instructions etc, for the Atari 400/800/XL/XE home computer series.

-Miner 2049er (cartridge)
-Pole Position (cartridge)
-The Institute (diskette)
-The Count (diskette)
-Lucifer's Realm (diskette)
-Ollie's Follies (any format)
-Ghost Chaser (any format)
-Koroni's Rift (any format)
-Karateka (any format)

I am not interested in buying budget label releases from the late 80's, I need the original early to mid 80's versions.

I live in Sweden and I will pay in advance for the games, packaging, shipping etc.

A FABULOU$ WAY TO TURN $6 DOLLARS INTO THOUSAND$
Thursday, 16 feb-2000

I found this on a bulletin board and decided to try it. A little while back, I was browsing through newsgroups and came across an article similar to this that said you could make thousands of dollars within weeks with only an initial investment of $6.00! So I thought, "Yeah right, this must be a scam", but like most of us, I was curious, so I kept reading. Anyway, it said that you send $1.00 to each of the 6 names and address stated in the article. You then place your own name and address in the bottom of the list at #6, and post the article in at least 200 newsgroups (there are thousands). No catch, that was it. So after thinking it over, and talking to a few people first, I thought about trying it. I figured, "What have I got to lose except 6 stamps and $6.00, right?" Then I invested the measly $6.00. Well, GUESS WHAT!!... Within 7 days, I started getting money in the mail! I was shocked! I figured it would end soon, but the money just kept coming in. In my first week, I made $25.00. By the end of the second week, I had made a total of over $1,000.00! In the third week I had over $10,000.00 - and it's still growing. This is now my fourth week and I have made a total of just over $42,000.00 and it's still coming in rapidly. It was certainly worth the $6.00, and six stamps. I have spent more than that on a lunch!!

Let me tell you how this works and, most importantly, why it works....also, make sure you print a copy of this article NOW, so you can get the information off of it as you need it. I promise you that if you follow the directions exactly, that you will start making more money than you ever thought possible by doing something so easy!

Suggestion: Read this entire message carefully! Print it out or download it. Follow the simple

directions and watch the money come in! It's easy. It's legal - and your investment is only
$6.00 (plus postage) .

IMPORTANT: This is not a scam; it is not indecent; it is not illegal; and it is virtually no risk - it
really works!!!! If all of the following instructions are adhered to, you will receive extraordinary
dividends.

PLEASE NOTE: Follow these directions EXACTLY and $50,000, or more, can be yours in 20
to 60 days. This program remains successful because of the honesty and integrity of the
participants. Please continue its success by carefully adhering to the instructions.

You will now become part of the Mail Order business. In this business, your product is not solid
and tangible, it's a service. You are now in the business of Developing Mailing Lists. Many large
corporations are willing and happy to pay big bucks for quality lists; however, the money made
from the mailing lists is secondary to the income which is made from people like you and me
asking to be included in that list.

Here are the 4 easy steps to success:

STEP 1: Get 6 separate pieces of paper and write the following on each piece of paper,
"PLEASE PUT ME ON YOUR MAILING LIST". Include your name and address. Now get six US
$1.00 bills and place ONE bill inside EACH of the 6 pieces of paper (so the dollar bill will not be
seen through the envelope - this is to prevent thievery). Next, place one paper (with the dollar
bill wrapped inside) into each of the 6 envelopes and seal the envelopes. You should now have
6 sealed envelopes, each with a piece of paper stating the above phrase, your name and
address, and a $1.00 bill. What you are doing is creating a service. THIS IS ABSOLUTELY
LEGAL! You are requesting a legitimate service and you are paying for it!

Like most of us, I was a little skeptical and a little worried about the legal aspects of it all so I
checked it out with the U.S. Post Office (1-800-725-2161) and they confirmed that it is indeed
legal!

Put a stamp on each envelope and mail the 6 envelopes to the following addresses:

#1 Dr. Harry T.K.
273 Coe St
Tiffin, OH 44883-3159

#2) Samantha Bussey
113 McHenry Road #234

#3) Micheal Kolb
12217 Barbary Rd
Philadelphia, PA 19154

#4) Natalie Surkova
506 Society Place
Newtown, PA 19056

#5) Greg
1317 Bristol Lane
Buffalogrove, ILL 60089

#6) Lucie E. Wright
1848 Todd Drive
Arden Hills, MN 55112

STEP 2: Now take the #1 name off the list that you see above, move the other names up (6
becomes 5, 5 becomes 4, etc.) and add YOUR Name as number 6 on the list.

STEP 3: Change anything you need to, but try to keep this article as close to the original as
possible. Now, post your amended article to at least 200 newsgroups (I think there are close to
24,000 groups). All you need is 200, but remember, the more you post, the more money you
make! This is perfectly legal! If you have any doubts, refer to Title 18 Sec. 1302 & 1341 of the
Postal laws. Keep a copy of these steps for yourself and whenever you need money, you can
use it again and again.

PLEASE REMEMBER that this program remains successful because of the honesty and
integrity of the participants and their carefully adhering to the directions. Look at it this way, if
you are of integrity, the program will continue and the money that so many others have
received will come your way also.

NOTE: You may want to retain every name and address sent to you, either on a computer or
hard copy and keep the notes people send you. This VERIFIES that you

are truly providing a
service. Also, it might be a good idea to wrap the $1 bill in dark
paper to reduce the risk of mail
theft. As each post is downloaded and the directions carefully
followed, six members will be
reimbursed for their participation as List Developers with one dollar
each. Your name will move
up the list geometrically so that when your name reaches the #1
position you will be receiving
thousands of dollars in CASH!!!

What an opportunity for only $6.00 ($1.00 for each of the first six
people listed above). Send it
now, add your own name to the list and you're in business!

DIRECTIONS FOR HOW TO POST TO NEWSGROUPS

Step 1) You do not need to re-type this entire letter to do your own
posting. Simply put your
cursor at the beginning of this letter and drag your cursor to the
bottom of this document, and
select 'copy' from the edit menu. This will copy the entire letter
into the computer's memory.

Step 2) Open a blank 'notepad' file and place your cursor at the top
of the blank page. From the
'edit' menu select 'paste'. This will paste a copy of the letter into
notepad so that you can add
your name to the list.

Step 3) Save your new notepad file as a .txt file. If you want to do
your postings in different
settings, you'll always have this file to go back to.

Step 4) Use Netscape or Internet explorer and try searching for
various newsgroups (on-line
forums, message boards, chat sites, and discussions).

Step 5) Visit these message boards and post this article as a new
message by highlighting the
text of this letter and selecting paste from the edit menu. Fill in
the Subject, this will be the
header that everyone sees as they scroll through the list of postings
in a particular group, click
the post message button. You're done with your first one!
Congratulations...THAT'S IT! All you
have to do is jump to different newsgroups and post away. After you
get the hang of it, it will
take about 30 seconds for each newsgroup!

**REMEMBER, THE MORE NEWSGROUPS YOU POST IN, THE MORE MONEY YOU WILL
MAKE!! BUT YOU HAVE TO POST A MINIMUM OF 200**

That's it! You will begin receiving money from around the world within days! You may
eventually want to rent a P.O. Box due to the large amount of mail you will receive. If you wish
to stay anonymous, you can invent a name to use, as long as the postman will deliver it.

** JUST MAKE SURE ALL THE ADDRESSES ARE CORRECT **

Now the WHY part: Out of 200 postings, say I receive only 5 replies (a very low example). So
then I made $5.00 with my name at #6 on the letter. Now, each of the 5 persons who just sent
me $1.00 make the MINIMUM 200 postings, each with my name at #5 and only 5 persons
respond to each of the original 5, that is another $25.00 for me. Now those 25 each make 200
MINIMUM posts with my name at #4 and only 5 replies each. I will bring in an additional
$125.00! Now, those 125 persons turn around and post the MINIMUM 200 with my name at #3
and only receive 5 replies each, I will make an additional $626.00! OK, now here is the fun part,
each of those 625 persons post a MINIMUM 200 letters with my name at #2 and they each only
receive 5 replies, that just made me $3,125.00!!! Those 3,125 persons will all deliver this
message to 200 newsgroups with my name at #1 and if still 5 persons per 200 newsgroups
react, I will receive $15,625.00 with an original investment of only $6.00! AMAZING!

When your name is no longer on the list, you just take the latest posting in the newsgroups,
and send out another $6.00 to names on the list, putting your name at number 6 and start
posting again. The thing to remember is that thousands of people from all over the world are
joining the internet and reading these articles everyday JUST LIKE YOU are now!! So, how can
you not afford the $6.00 to see if it really works?? I think you can't afford the opposite - to not
give it a try. People have said, "What if the plan is played out and no one sends me the
money?" So what! It's only six bucks. What are the chances of that really happening anyway
when there are tons of new honest people who are joining the internet and newsgroups
everyday and who are willing to give it a try? Estimates are at 20,000 to 50,000 new users,
every day, with thousands of those joining the actual internet.

Remember, play FAIRLY and HONESTLY - We're all on this planet together
and we're here to
love one another. Can you think of a better way than to treat one
another kindly and to share
the wealth?

A FABULOU$ WAY TO TURN $6 DOLLARS INTO THOUSAND$
Thursday, 16 feb-2000

I found this on a bulletin board and decided to try it. A little while back, I was browsing through newsgroups and came across an article similar to this that said you could make thousands of dollars within weeks with only an initial investment of $6.00! So I thought, "Yeah right, this must be a scam", but like most of us, I was curious, so I kept reading. Anyway, it said that you send $1.00 to each of the 6 names and address stated in the article. You then place your own name and address in the bottom of the list at #6, and post the article in at least 200 newsgroups (there are thousands). No catch, that was it. So after thinking it over, and talking to a few people first, I thought about trying it. I figured, "What have I got to lose except 6 stamps and $6.00, right?" Then I invested the measly $6.00. Well, GUESS WHAT!!... Within 7 days, I started getting money in the mail! I was shocked! I figured it would end soon, but the money just kept coming in. In my first week, I made $25.00. By the end of the second week, I had made a total of over $1,000.00! In the third week I had over $10,000.00 - and it's still growing. This is now my fourth week and I have made a total of just over $42,000.00 and it's still coming in rapidly. It was certainly worth the $6.00, and six stamps. I have spent more than that on a lunch!!

Let me tell you how this works and, most importantly, why it works....also, make sure you print a copy of this article NOW, so you can get the information off of it as you need it. I promise you that if you follow the directions exactly, that you will start making more money than you ever thought possible by doing something so easy!

Suggestion: Read this entire message carefully! Print it out or download it. Follow the simple

directions and watch the money come in! It's easy. It's legal - and your investment is only
$6.00 (plus postage) .

IMPORTANT: This is not a scam; it is not indecent; it is not illegal; and it is virtually no risk - it
really works!!!! If all of the following instructions are adhered to, you will receive extraordinary
dividends.

PLEASE NOTE: Follow these directions EXACTLY and $50,000, or more, can be yours in 20
to 60 days. This program remains successful because of the honesty and integrity of the
participants. Please continue its success by carefully adhering to the instructions.

You will now become part of the Mail Order business. In this business, your product is not solid
and tangible, it's a service. You are now in the business of Developing Mailing Lists. Many large
corporations are willing and happy to pay big bucks for quality lists; however, the money made
from the mailing lists is secondary to the income which is made from people like you and me
asking to be included in that list.

Here are the 4 easy steps to success:

STEP 1: Get 6 separate pieces of paper and write the following on each piece of paper,
"PLEASE PUT ME ON YOUR MAILING LIST". Include your name and address. Now get six US
$1.00 bills and place ONE bill inside EACH of the 6 pieces of paper (so the dollar bill will not be
seen through the envelope - this is to prevent thievery). Next, place one paper (with the dollar
bill wrapped inside) into each of the 6 envelopes and seal the envelopes. You should now have
6 sealed envelopes, each with a piece of paper stating the above phrase, your name and
address, and a $1.00 bill. What you are doing is creating a service. THIS IS ABSOLUTELY
LEGAL! You are requesting a legitimate service and you are paying for it!

Like most of us, I was a little skeptical and a little worried about the legal aspects of it all so I
checked it out with the U.S. Post Office (1-800-725-2161) and they confirmed that it is indeed
legal!

Put a stamp on each envelope and mail the 6 envelopes to the following addresses:

#1 Dr. Harry T.K.
273 Coe St
Tiffin, OH 44883-3159

#2) Samantha Bussey
113 McHenry Road #234

#3) Micheal Kolb
12217 Barbary Rd
Philadelphia, PA 19154

#4) Natalie Surkova
506 Society Place
Newtown, PA 19056

#5) Greg
1317 Bristol Lane
Buffalogrove, ILL 60089

#6) Lucie E. Wright
1848 Todd Drive
Arden Hills, MN 55112

STEP 2: Now take the #1 name off the list that you see above, move the other names up (6
becomes 5, 5 becomes 4, etc.) and add YOUR Name as number 6 on the list.

STEP 3: Change anything you need to, but try to keep this article as close to the original as
possible. Now, post your amended article to at least 200 newsgroups (I think there are close to
24,000 groups). All you need is 200, but remember, the more you post, the more money you
make! This is perfectly legal! If you have any doubts, refer to Title 18 Sec. 1302 & 1341 of the
Postal laws. Keep a copy of these steps for yourself and whenever you need money, you can
use it again and again.

PLEASE REMEMBER that this program remains successful because of the honesty and
integrity of the participants and their carefully adhering to the directions. Look at it this way, if
you are of integrity, the program will continue and the money that so many others have
received will come your way also.

NOTE: You may want to retain every name and address sent to you, either on a computer or
hard copy and keep the notes people send you. This VERIFIES that you

are truly providing a
service. Also, it might be a good idea to wrap the $1 bill in dark
paper to reduce the risk of mail
theft. As each post is downloaded and the directions carefully
followed, six members will be
reimbursed for their participation as List Developers with one dollar
each. Your name will move
up the list geometrically so that when your name reaches the #1
position you will be receiving
thousands of dollars in CASH!!!

What an opportunity for only $6.00 ($1.00 for each of the first six
people listed above). Send it
now, add your own name to the list and you're in business!

DIRECTIONS FOR HOW TO POST TO NEWSGROUPS

Step 1) You do not need to re-type this entire letter to do your own
posting. Simply put your
cursor at the beginning of this letter and drag your cursor to the
bottom of this document, and
select 'copy' from the edit menu. This will copy the entire letter
into the computer's memory.

Step 2) Open a blank 'notepad' file and place your cursor at the top
of the blank page. From the
'edit' menu select 'paste'. This will paste a copy of the letter into
notepad so that you can add
your name to the list.

Step 3) Save your new notepad file as a .txt file. If you want to do
your postings in different
settings, you'll always have this file to go back to.

Step 4) Use Netscape or Internet explorer and try searching for
various newsgroups (on-line
forums, message boards, chat sites, and discussions).

Step 5) Visit these message boards and post this article as a new
message by highlighting the
text of this letter and selecting paste from the edit menu. Fill in
the Subject, this will be the
header that everyone sees as they scroll through the list of postings
in a particular group, click
the post message button. You're done with your first one!
Congratulations...THAT'S IT! All you
have to do is jump to different newsgroups and post away. After you
get the hang of it, it will
take about 30 seconds for each newsgroup!

**REMEMBER, THE MORE NEWSGROUPS YOU POST IN, THE MORE MONEY YOU WILL
MAKE!! BUT YOU HAVE TO POST A MINIMUM OF 200**

That's it! You will begin receiving money from around the world within days! You may
eventually want to rent a P.O. Box due to the large amount of mail you will receive. If you wish
to stay anonymous, you can invent a name to use, as long as the postman will deliver it.

** JUST MAKE SURE ALL THE ADDRESSES ARE CORRECT **

Now the WHY part: Out of 200 postings, say I receive only 5 replies (a very low example). So
then I made $5.00 with my name at #6 on the letter. Now, each of the 5 persons who just sent
me $1.00 make the MINIMUM 200 postings, each with my name at #5 and only 5 persons
respond to each of the original 5, that is another $25.00 for me. Now those 25 each make 200
MINIMUM posts with my name at #4 and only 5 replies each. I will bring in an additional
$125.00! Now, those 125 persons turn around and post the MINIMUM 200 with my name at #3
and only receive 5 replies each, I will make an additional $626.00! OK, now here is the fun part,
each of those 625 persons post a MINIMUM 200 letters with my name at #2 and they each only
receive 5 replies, that just made me $3,125.00!!! Those 3,125 persons will all deliver this
message to 200 newsgroups with my name at #1 and if still 5 persons per 200 newsgroups
react, I will receive $15,625.00 with an original investment of only $6.00! AMAZING!

When your name is no longer on the list, you just take the latest posting in the newsgroups,
and send out another $6.00 to names on the list, putting your name at number 6 and start
posting again. The thing to remember is that thousands of people from all over the world are
joining the internet and reading these articles everyday JUST LIKE YOU are now!! So, how can
you not afford the $6.00 to see if it really works?? I think you can't afford the opposite - to not
give it a try. People have said, "What if the plan is played out and no one sends me the

$1.00 bills and place ONE bill inside EACH of the 6 pieces of paper (so the dollar bill will not be
seen through the envelope - this is to prevent thievery). Next, place one paper (with the dollar
bill wrapped inside) into each of the 6 envelopes and seal the envelopes. You should now have
6 sealed envelopes, each with a piece of paper stating the above phrase, your name and
address, and a $1.00 bill. What you are doing is creating a service. THIS IS ABSOLUTELY
LEGAL! You are requesting a legitimate service and you are paying for it!

Like most of us, I was a little skeptical and a little worried about the legal aspects of it all so I
checked it out with the U.S. Post Office (1-800-725-2161) and they confirmed that it is indeed
legal!

Put a stamp on each envelope and mail the 6 envelopes to the following addresses:

#1 Dr. Harry T.K.
273 Coe St
Tiffin, OH 44883-3159

#2) Samantha Bussey
113 McHenry Road #234

#3) Micheal Kolb
12217 Barbary Rd
Philadelphia, PA 19154

#4) Natalie Surkova
506 Society Place
Newtown, PA 19056

#5) Greg
1317 Bristol Lane
Buffalogrove, ILL 60089

#6) Lucie E. Wright
1848 Todd Drive
Arden Hills, MN 55112

STEP 2: Now take the #1 name off the list that you see above, move the other names up (6 becomes 5, 5 becomes 4, etc.) and add YOUR Name as number 6 on the list.

STEP 3: Change anything you need to, but try to keep this article as close to the original as possible. Now, post your amended article to at least 200 newsgroups (I think there are close to 24,000 groups). All you need is 200, but remember, the more you post, the more money you make! This is perfectly legal! If you have any doubts, refer to Title 18 Sec. 1302 & 1341 of the Postal laws. Keep a copy of these steps for yourself and whenever you need money, you can use it again and again.

PLEASE REMEMBER that this program remains successful because of the honesty and integrity of the participants and their carefully adhering to the directions. Look at it this way, if you are of integrity, the program will continue and the money that so many others have received will come your way also.

NOTE: You may want to retain every name and address sent to you, either on a computer or hard copy and keep the notes people send you. This VERIFIES that you

are truly providing a
service. Also, it might be a good idea to wrap the $1 bill in dark
paper to reduce the risk of mail
theft. As each post is downloaded and the directions carefully
followed, six members will be
reimbursed for their participation as List Developers with one dollar
each. Your name will move
up the list geometrically so that when your name reaches the #1
position you will be receiving
thousands of dollars in CASH!!!

What an opportunity for only $6.00 ($1.00 for each of the first six
people listed above). Send it
now, add your own name to the list and you're in business!

DIRECTIONS FOR HOW TO POST TO NEWSGROUPS

Step 1) You do not need to re-type this entire letter to do your own
posting. Simply put your
cursor at the beginning of this letter and drag your cursor to the
bottom of this document, and
select 'copy' from the edit menu. This will copy the entire letter
into the computer's memory.

Step 2) Open a blank 'notepad' file and place your cursor at the top
of the blank page. From the
'edit' menu select 'paste'. This will paste a copy of the letter into
notepad so that you can add
your name to the list.

Step 3) Save your new notepad file as a .txt file. If you want to do
your postings in different
settings, you'll always have this file to go back to.

Step 4) Use Netscape or Internet explorer and try searching for
various newsgroups (on-line
forums, message boards, chat sites, and discussions).

Step 5) Visit these message boards and post this article as a new
message by highlighting the
text of this letter and selecting paste from the edit menu. Fill in
the Subject, this will be the
header that everyone sees as they scroll through the list of postings
in a particular group, click
the post message button. You're done with your first one!
Congratulations...THAT'S IT! All you
have to do is jump to different newsgroups and post away. After you
get the hang of it, it will
take about 30 seconds for each newsgroup!

**REMEMBER, THE MORE NEWSGROUPS YOU POST IN, THE MORE MONEY YOU WILL
MAKE!! BUT YOU HAVE TO POST A MINIMUM OF 200**

That's it! You will begin receiving money from around the world within days! You may
eventually want to rent a P.O. Box due to the large amount of mail you will receive. If you wish
to stay anonymous, you can invent a name to use, as long as the postman will deliver it.

** JUST MAKE SURE ALL THE ADDRESSES ARE CORRECT **

Now the WHY part: Out of 200 postings, say I receive only 5 replies (a very low example). So
then I made $5.00 with my name at #6 on the letter. Now, each of the 5 persons who just sent
me $1.00 make the MINIMUM 200 postings, each with my name at #5 and only 5 persons
respond to each of the original 5, that is another $25.00 for me. Now those 25 each make 200
MINIMUM posts with my name at #4 and only 5 replies each. I will bring in an additional
$125.00! Now, those 125 persons turn around and post the MINIMUM 200 with my name at #3
and only receive 5 replies each, I will make an additional $626.00! OK, now here is the fun part,
each of those 625 persons post a MINIMUM 200 letters with my name at #2 and they each only
receive 5 replies, that just made me $3,125.00!!! Those 3,125 persons will all deliver this
message to 200 newsgroups with my name at #1 and if still 5 persons per 200 newsgroups
react, I will receive $15,625.00 with an original investment of only $6.00! AMAZING!

When your name is no longer on the list, you just take the latest posting in the newsgroups,
and send out another $6.00 to names on the list, putting your name at number 6 and start
posting again. The thing to remember is that thousands of people from all over the world are
joining the internet and reading these articles everyday JUST LIKE YOU are now!! So, how can
you not afford the $6.00 to see if it really works?? I think you can't afford the opposite - to not
give it a try. People have said, "What if the plan is played out and no one sends me the
money?" So what! It's only six bucks. What are the chances of that really happening anyway
when there are tons of new honest people who are joining the internet and newsgroups
everyday and who are willing to give it a try? Estimates are at 20,000 to 50,000 new users,
every day, with thousands of those joining the actual internet.

Remember, play FAIRLY and HONESTLY - We're all on this planet together
and we're here to
love one another. Can you think of a better way than to treat one
another kindly and to share
the wealth?

Ronen,

Since the Atari 400 was the first computer I ever owned, I am very partial to it and find it the "mouse that roared" of the Atari 8-bit world.
My original "Franken400" (Which my dad prefers to call "Goodwin's Monster" since Frankenstein was the name of the professor not the creation... technical, technical...) with 48K and added 1400 XL keyboard can be seen at:

http://www.geocities.com/clu-da-bard/Aut_0017.jpg

My dad and I have worked on that computer off an on since I got it. The keyboard used to sit on top of the 400 since we didn't originally think a 1200/1400 keyboard could fit in a 400 case. Then late last year we took a drummel tool and started filing down the case, and moved a capasitor or two and a LED, and I can say it makes a nice tight fit. I took a dead 400 keyboard and removed some of the sticky portion of the keys to label the unmarked silver keys.

I've met up with Wes Newell lately here in Dallas, and he runs a BBS called Wylie Connection 972-429-7005 (has lots of Atari message areas BTW.. shameless plug) and he did a lot of upgrades to Atari 8-bit and ST machines. And he loves to keep up with the Atari hobby scene though he doesn't have one any more himself.
But he did a 64K modification to an Atari 400. Said it was a board that could be plugged into the one memory port of the 400 which was connected to another mother board which allowed for three more slots. Though I'm trying to find more details ever so often (what he did was a prototype that he sold to someone years ago), I wonder if the partially working Atari 800 I have (player missile graphics dead on it) couldn't serve as a nice expansion board for my 400. Hmmm....

Someday I plan to break the 48K barrier on the 400... once I figure out exactly what my dad did to upgrade the computer. hehe.. It's been so long even my dad doesn't remember.

Ronen,

How does that SideWriter keyboard work, or I should say, how was it connected. I vaguely remember it in the late 80's. Looks really cool.

I also remember the little sticky keys you could add to the top of the 400, and I remember thinking how neat those were since they had the same design in many ways as the Tandy color Computer keys, which to this day I think was one of the neatest key designs.

Of course the 400 is cool since it was one of the few to have the McDonald's register keyboard. :) It would be neat if someone were to use them again for field applications, and who knows, maybe they do.

In the movie TRON Mr. Dilliger had a cool desk I wouldn't mind seeing. It was a black desk with a glass top. Pretty ornate but simple looking. You tap an area on it, and you find a computer monitor built inside of it, and a flat, touch sensitive keyboard lights up on the glass itself.

Now I wouldn't mind having THAT computer setup at work.

Ever since the 400 (And the Odessey II, people forget about that being the other that had it) I have wondered the applications of membrane keyboards.

Anywho, off on a tangent there, still would love to learn more about the SideWriter. :)

From: Greg Goodwin <drclu@swbell.net>
Message-ID: <38AE74F1.53C3@swbell.net>
Source record: 46490

I'm kinda with James on the problem with the monitor. There are a few solutions however.

If you are a Macintosh user, some Macintosh computers have an option of a RF module that allows the Macintosh to be used as a TV. This also make a good monitor for the 8-bit computer sitting nearby. Still thinking of this option, and in time, I will probably go this route.

ST and Amiga computers, since at least the earlier versions tended to have an RF option, can be used and share an RF connection with a monitor. I currently have two ST computers aiding my Atari 400, and they share the same monitor with a RF switch.

PC computers, most people tend to find it easier to emulate an Atari 8-bit and go from there. Though with the the mob of technology for the PC you would think someone out there has developed (It HAS to be out there.. I'm just not a PC user) a RF board to allow the PC to be used as a TV. This, once again, would give a monitor to the 8-bit computer.

But the problem is a real, and 8-bit computers do tend to sprawl out with all the wonderful devices you can get for it.

As for stocking up... don't know what to say about that. The Atari has been discontinued for almost a solid decade (Atari stopped supporting the 8-bit around 1991 or 92 right?) Yet in 2000 we are still finding these computers fun.

Will it ever completely vanish. No. I don't see it happening. I see a lot of equipment floating around, and I know a lot of those have had too much fun to simply throw any of it away. They either sell it or make sure it has a nice home.

The Atari 8-bit has survived into antiquity for two reasons, it is a fun machine to play games on, and it is fun to hack. And those joystick ports are actually quite useful for a good lot of things. (remote control, robotics, etc, etc....)

I think the users will be a while yet. :)

I've never had a problem. I would boot a copy protected AR Dungeon disk as
drive 1 with sio2pc drives as 2-4. I have only used it with 810s, 1050s, and
a US Doubler 1050, but never any problems.

> Jaguar CD out performs PlayStation.
I don't think so. The Jag had some serious hardware limitations. On paper it looks like it ought to be able to chuck polys around nicely but the reality is different. The memory bus was crippled at a late stage introducing some big problems with concurrency eg you can't have moving graphics as a sample is playing without some veryclever design and even then you have to have poor sample rates or not much GFX going on. There were other problems too. I did some work for Atari at a trade show and the SOny stand was next to the Jaguar one and comparing the two sets of games was embrassing and that was in the very early days of the the PSX. Later games got even better on it. I've had some dealings with Jag developers and done some beta testing etc and trust me, nice as it was, the Jag wasn't a PSX beater no matter how badly you'd like it to be.

Not sure if you are aware of the difs. SIO2PC cable for transferring files
to an IBM would mean that you have both a real Atari 8 bit and a real 8 bit
drive like a 1050. The Prosys cable is different and not interchangible, but
allows you to make copies your disks using only an 8 bit drive and an IBM
compatible computer.

There is someone from Europe that sells SIO2PC cables on eBay for ~$25 and
seems to be very highly reccomended by buyers. He has to keep costs/weight
down by using fairly short cables though.

Clarence Dyson has done a really excellent job of putting a hobbiest guide
to assembling the cables if you want to try to build one yourself.

http://www.redshift.com/~cdyson/atari.html

What is a "DOS compatible" printer.The handler for the printer is built into
the Atari.And if you're talking about the IBM,DOS doesn't handle that either.
(that's handled by the built-in ROM (BIOS) as well)

Well,the fact that he talks (in the manual) as if "3X" (57600 baud) is some how
the fastest that you'll ever see on the Atari is mysterious.Also the fact that
he refers to "2X" (38400 baud) as "UltraSpeed" when Ultraspeed is a protocol
and not a actual baud rate or BPS rating.And if he meant the 1050 with US
Doubler upgrade,that runs at 53200 baud,which is closer to 3X than 2X.There's
also the fact that programmes can't tell when you replace one "floppy disk"
(ATR file) with another one so programmes that depend on that (and don't
include a manual way to indicate a disk change) will just sit there waiting for
ever for you to open and shut the drive's door/latch.Oh,and when programmes ask
the "disk drive" (i.e.APE) how many sectors are on the current disk,it always
gives a number twice as big since it always indicates single-sided disks as
being double-sided and REAL double-sided disks as being TRIPLE-SIDED!
(of course this only affects format and disk fix programmes as DOS just checks
a number on the disk rather than asking the drive it-self,but still...)

>Thanks for any response. $100 isn't a fortune, but it's a goodly amount
>of money to simply spend on my Atari. Still, getting those floppies
>over to the PC is pretty important to me, for preservation purposes.

There's really no purpose to buying the software if you're just going to use it
to archive your disks.Registration just means that you can write to a ATR file
at 57600 instead of 38400 baud.Remember that the slowest Ultraspeed drive (e.g.
1050 with US Doubler upgrade) is 53200 baud so it's hardly "greased lightning".

>.obj files.

ProDOS (on the Apple) did the same thing.It was designed for 512 byte blocks so
it would put two 256 byte (Disk][) sectors in each block.What was annoying is
that they didn't just use 512 byte sectors and try to get more disk space out
of the deal.And,of course,you get MAMMOTH block sizes on the Macintosh and IBM
computers.
(even with the 32-bit FATs you get 4 KILOBYTE sectors!!!)

>Just my op, but in anything Atari storage you are going to do, you will have
>this type of file storage problem. Specifically, most Atari files are 4-32k
>in lenght, so even when you start talking 16 meg of storage per hard drive
>partition you have to take the number of files into account.

You could do like BSD UNIX and have the last few hundred bytes of several files
share one "block".BSD UNIX did this so that it could be used with bigger fixed
disks.
(presumably it had 16-bit FATs ("indirect blocks"))
Each file would have a "fragment" number,which told which part of the 4k block
the end of the file was in,and how many fragments it took up.Linux disks have
fragments on them,but Linux's "ext2" DOS only supports disks which have the
fragments the same size as the blocks (usually 1k) so there is basicly no
support for fragments in Linux.
(unless version 2.2 of Linux implemented them;we've been waiting a LONG time)

But is there really any point to having bigger partitions?
The new ATA interfaces give you 16+ partitions at a time.Do you really need
disks with HUNDREDS of megabytes of storage on them?
And if it's a question of BBS downloads,BBSes should have a option of running a
programme before accessing certain drives.This programme could be a simple
assembly programme to change the drives/partitions around.

Well, BJ-200 is compliant with dos, my BJC-6000 is not. I can't print from DOS with that. I also know the OKI 4 (something) a laser printer is Windows only.

There is a danger in thinking you are a typical Atari user. I mean I thought I was typical until I started running into people that only owned an Atari 400 and 5-10 carts.

But I can't get past thinking that the typical Atari owner on average has at least 2 disk drives and on average 200 disks. My collection of Antic and ANALOG disks is probably over 50 disks alone.

200X150k<avg density from double, single, flippies, etc> =>30000k or 30,000,000. I am kind of the Oscar Madison of file organization, but I realize some people are "Everything in its place and a place for everything" Felix Unger types.
> And if it's a question of BBS downloads,BBSes should have a option of

The BSD stuff was interesting, it made me think a little retro. I think some of the first disk drives for micros were not very sophisticated, just stacked files on a disks one right after another w/o file allocation blocks and whatnot.

I would guess 90% of the stuff I have is essentially read only. What would work and be fairly easy to implement on an Atari for things like a bbs/archival purposes is just having the files appended to each other with a directory structure that functions as an index into the big file. Something like a directory structure that is MYFILE.001 1039<first byte of file> 8920<last byte of file> MYFILE.001 8921<first byte of file> 16233<last byte of file>. The actual storage would just be a large hunk of hard drive partition set aside/marked as in use for the file with the first byte of the first sector => byte zero.

I have encountered several UK and European games that did not worked
on the NTSC machine (like T-34 etc...)

you can easily fix that by replacing you Antic chip with a PAL one..
then both PAL and NTSC games/demos will work on your machine

check:

http://thor.prohosting.com/~atari8/palntsc.htm

This page that Vidar "Hawk" Olavesen has created is a valuable
resource. I have to say that I have dealt with numerous people over the
internet, and all those people except one were honorable in that they
did what they said they would do, or at least tried to make some
retribution with sincerest apologies.

Know that we can not only warn each other of that occational thief
in the fold with this web page, but there is now a Comsumer Protection
Division to file a formal report. I am filing such a report, and after
message from Vidar below, I will mention more information about the one
bad trader I have encountered in my tradings. Again, my thanks to the
rest of you for making the Atari experience a fun one.

@>-->--------------------

Trader name: Ron & Mary Schwab
Alias: "Qtip"

Address: 855 L Street
Gering, NE 69341

E-Mail address qtip@scottsbluff.net
qtip@excalibur.scottsbluff.net

Confirmed by drclu@swbell.net

Background story:
Back in late October'99 the the trader known as "Qtip" announced
that he/she was selling a bunch of Jaguar equipment and claimed to have
two catboxes.

Made a deal to buy a Catbox, & Dragon's Lair CD + shipping for
$50. Payment was sent out, and check was cleared in early November.
Weeks passed, and then upon asking, I was told the plumbing had backup
in the back room where the games were and they need testing.
Realizing the time it would take, asked for a refund to be sent
and that we would try the trade later when everything was cleaned up.
"Qtip" promised refund. After that, weeks would pass, then questions
asked answered with promises of refunds being sent. Finally in late
December the trader in anger said that a refund was sent with a money
order, and unprofessionally said no money order number would be given to
track the money order, nor would any other responses be given to the
status of the refund.
Currently in February I have yet to see the refund, and the trader
no longer replies to E-mails.

I am currently filing a formal report with the Consumer Protection
Division which is a branch of the FBI. If anyone else has had any bad
business dealings with the trader "Qtip", please send E-mails to:

drclu@swbell.net

Thank you for your time,

Doctor Clu

Way back when, dark ages kind of thing, there was Compucat BBS. The original incarnation of it ran on eight modified 810 drives IIRC. Neil Kinney, the sysop, had an online store with complete prices lists, specials, that kind of stuff. There was also an adventure game built into the BBS, standard "You are in an elevator and you see buttons marked up and down. Which way will you go?" kind of thing.

Of course as soon as the ST came out he switched. He still has the adventure up now, but it is as web pages.

Some people are just different I guess. I probably have 7-8 drives laying around, but whenever I run my system I just have one real 1050 type drive and let the others collect dust.

I am just getting rid of loose chips and doing some things like measuring
voltages at pins as I have never bothered. Ergo I am just going to ask
Carolyn for her cable in exchange so I can see why it failed and a couple of
bucks for the others.

There are issues that Nir brought up in email that would be nice to see
addressed, things like the emulator writers supporting the cable, but for
the most part I just want to add some data that will help debugging ~5 years
late.

I'm really bad at guessing prices, I think some people paid me ~$25 for
SIO2PC cables back when I was doing the 4049 => 74LS00 => 1489 jumping through hoops, but I
probably gave away as many as I
sold. Sheesh! Bill Kendrick even got one with an LED data line monitor.

Just MHO, but I think $25 is a fair price. ~$8 in parts, $1 for blister pack mailer and
$1.29 for postage last time I
checked.

A little birdie told me about myself, said "CHEAP CHEAP CHEAP!". I even cut
the RS 417 hole general purpose PC boards in 1/2 so they will fit in the
smallest $2 case RS sells and make 2 cables from them. I am abnormal! I
don't expect everyone to do what I do. I don't even buy strain reliefs for
cables, I just dose them with large gobs of gunk from my hot melt glue gun.

But they take ~20-40 minutes each to make once you get your mojo working,
plus you can sort of tack on the time it take to buy materials and mail
them. @$25 you would be making ~$10-$17 profit each, so it should translate
to $10-$51 per hour depending on how good you are. Just my op, but that is
about right. The cables are not fun to make after say, the first 2. It is
really like work after the first couple anyway, nothing like a hobby or
something you would do for fun. I swear, after you make 10 of them, you
won't make another for less then 60 bucks!

Nice, but he doesn't mention if it's a 16 k ram (in which all of those carts would work) or if it's the 48 k, which would allow it to work well with a disk drive. Nex (ex 400 owner from way back)

> in theroy.
>
> James B

Hello James,
yes there is something that stops us from having 65535 banks on a cart !! Some cartridge location holds the info for avaiable banks, this location only allows banks 00-ff (thats 256 banks). So you can merely have 256 banks of up to 16k. You can use 4k bankswitching like OSS, 8k bankswitching like Atari or use your own way of 16k bankswitching (besides you could also use 1k or 2k bankswitching).
A friend of mine is currently testing the different bankswitching techniques on Atari cartridges (which differ from Ramdisk bankswitching!). I hope we are lucky enough to get bigger carts than 128k, since I would like to get an up to 4MB cart (256 banks of 16k, if thats possible)... Andreas Magenheimer

Hi Folks!

Many years ago, I programmed 4 AMS files: A Kind of Magic, Stereotomy, True Colors and Tonight She Comes. I have found one of them, A Kind of Magic, in the AMS archives of Atari 800 files, but the other three are still lost.

I'll pay $100 EACH to anyone who can come up with any of the other three files. I remember their file names as:

STROTOMY.AMS
TRUCOLOR.AMS
TNSHECMS.AMS

For anyone who remembers the old BBS circuit, I was Mr. Roboto, sysop of the STYX BBS. A belated hello to anyone from the past :-)

I posted them to many BBSes at that time. Thanks in advance for any help you can give!

Probably because Hasbro is making money off the licenses given by
Hasbro and will treat it as if it's their own. It's like in the States
the whole Pac-Man francise was "owned" by Midway even though Namco
licensed it to them.

> It would be humorus if Hasbro released another updated Namco game like
> "Ms. Pacman" only to be tapped on the shoulder by Namco wondering why
> Hasbro believed they owned other popular Namco titles.

I think that that might include other Pac-Man titles in the agreement,
I'm not sure. That's interesting consdiering that Midway made Ms. Pac-
Man and not Namco, but you'll find Ms. Pac-Man on PSX and GBC
from...you guessed it, Namco.

> Other oddball things I wonder about is will Hasbro pacman stuff end
up on
> the
> playstation? That would be dilution of tradmark that Namco enjoys on
the
> playstation.

Because Namco already has Pac-Man World for PSX, so you won't find
Hasbro's Pac-Man on PSX...only on the PC which Namco won't develop
for. At least you can play Pac-Man World on bleem! :)

> (It would be sweet to see two Giants battle royal over

True...but corporations would rather do "business" with each other and only sue as a last resort. It's like a powerful nation trying to have good dipolmatic relations with another powerful nation while waging war only with small weak countries. Sad but true...

1314. Tech: 130XE Black Screen and a Tone.

Newsgroup: comp.sys.atari.8bit
Date: 2000-02-21 00:00:00 UTC
From: Marshall Walker <mwalker@mc.net>
Message-ID: <88rmer$ao1$1@ffx2nh3.news.uu.net>
Source record: 46525

Hi All you Techies.

I have a 130XE computer that I have tried to upgrade with Steven Tuckers Ape OS+. I followed the directions that Steve gave.. Had a bugger of a time removing the solder from the pins using de-solder wick and a solder sucker. (I think this is where I might have damaged the board?)

When I installed the socket, and put in the old OS, I get a black screen, and a constant tone out of the monitor speaker... I get the same thing when I install the Ape OS+.

Did I happen to destroy a trace, or maybe shock something important? Because I looked over the soldering joints, and looked around the socket, and can't see any broken traces, but they're might be.. I got a little rough with it.. anyway.. if need be, I have a nice big spool of 30 gauge wire sitting here ready to be used to jumper traces.

Any help will be appreciated.

I often do!

. They bought up several software companies and used
> them to make games for the names they purchased. This is how you make a
name
> for yourself?

Hasbro really doesn't HAVE to make a name for themselves. However, I follow your point if you are referring to PC and console games. There is an interesting (to me) trend lately of re-using old concepts and slapping a recognizable name on a recycled game from the classis era. I ought to know, I own the new versions of Pong, Frogger, Centipede, Space Invaders, Asteroids, Q*Bert, Battlezone (not a re-hash at all but a totally new game) and I may pick up Missile Command soon.

Of those, most of them are disappointing. The few I enjoy and continue to play are Pong, Space Invaders, and a little Q*Bert from time to time - although the MAME version of Q*Bert is FAR superior and more fun.

The games that alarm me the most are the ones that rely on 3D acceleration when they really don't need it - and since all the programmer's resources went into figuring out how to make a 2D game like Frogger suddenly be a 3D game, they ran out of creativity when they got around to trying to make a FUN game. Look at Sinistar Unleashed. What a failure that game is. No fun, and it doesn't resemble the original AT ALL. They lost out on both points there - old-timers (like me) didn't buy it because it wasn't enough like the original, and young whippersnappers stayed away because it got bad reviews!

Let's face it: Frogger would have been tons better if it had been updated to the level of **2D** graphics our PC's and consoles are capable of today. More detail, more color, higher resolution - but keep a 2D game 2D. Just 'cause you HAVE a 3D card doesn't mean you SHOULD use it for everything. Look at SubSpace, the online Space Wars evolutionary hybrid. It's in 2D and it's still one of the most popular computer games out there. 3D support would kill it and probably would not add a darn thing to the game.

Ah hell, I digress. The simple fact is Hasbro and Activision are both rehashing old games. True - I give you that. Does it make Hasbro a video gaming company? Debatable. I tend to side with Hasbro proponents since I like a couple of their titles.

> It's too late to remove the "ergonomically planned" claim from the
> ProController packaging, but please explain your discomfort.

I have small hands and the controller was unweildy for me. Here we get into opinion, so I'll stop pursuing that point.

> I don't understand the toilet seat reference. I'd think being a custodian at
> one point would make me aware of such similarities... but Jaguar is better
> suited for certain games than PlayStation.

A popular gaming magazine actually brought that to my attnetion. THe CD drive sitting on top of a Jag looks sort of like a toilet with the lid down. Doesn't affect the system though - and I would like to point out two very important things right here. I plan to buy a Jag in the near future to complete my Atari collection (I have a 2600, 7800, and Lynx - I want a Jag+CD and no, I don't want a 5200. Never liked 'em. I also have a 520ST I hacked four megs of RAM into, and an 800 and 130XE with all the peripherals). So I am not "Anti Atari" by any means.

Secondly, I have to bow to the reference that certain games work better on a Jag than a PSX. FOr some reason the PSX hase very few 2D scrollers or shooters - a genre that I like. Aero Fighters, 1943, Raiden, - those are the games I like. Yes, some of those are on PSX but the Jag has some very interesting offerings, too. And have you seen Tempest on both systems? The PSX version comes nowhere near the Jag version.

But I still stand by my original statement that the PSX is more powerful overall. And the PSX 2 has specs that show that it can do more operations per second than the Cray Supercomputer. It doesn't come with built-in seats and it looks more like a brick than the PSX1.

> comparable. Check out www.allgame.com to compare stats on different systems.
> They are noticably lacking in detail on Jaguar, but Atari's own stats were
> not exactly on track. Fogging and Transparency can be done on Jaguar

Thanks for the link, I will use it. And yes, fogging and transparency WERE used on the Jag - every time Atari Corp tried to compare it to systems like the Saturn, N64, and PSX they used transparent lies and tried to fog the issues at hand. I remember some really heated interviews in my gaming mags. Wish I still had those available to quote. The whole time the Jag was the only power machine on the block, Atari sat on their hands - and when the PSX and N64 started getting all the positive press, they began making exaggerated claims about the system's power.

> I'll have to look at the iMacs... if this is another toilet-like reference,
> I won't see it.

No, the pack-in mouse for the iMac is a small, round, single button disc. NOT ergonomic and NOT functional. First thing iMac buyers do is buy a new mouse. Oh, and an external drive (like a Zip drive) since the iMac does not come with a removable storage device - right, no floppy or Zip drive.

What's with Mac users, anyway? Haven't they ever learned that they can use more that one finger to click - all the mice have only one button.Proponents

will obviously claim it's due to the obscenely easy interface - "you only need one button!" But I suspect it has something to do with a half duplex thought processing model on the user's part. One mouse button is about all they can handle ;)

Just kidding - Now I can expect a mail bomb from every Mac user in RGVAC!

Anyway - that was longer than I intended and now I guess I had better get back to work! I still stand by my original statement: To each his own, pick what you like and stick with it.

>
Well, here is what I know:
At the back there is a 25-pin D-type connector.
On the ATARI-400 that came with it, there is the opposite D-type connector
(this one looks like a 'do-it-yourself' installation). I think that
internally it is connected instead of the original flat cable the used to go
to the original keyboard...
My assumption is that a regular 25-wires flat cable should be used to
interconnect the two...
I'm still waiting for a friend to loan me a flat cable so I could test it...

I asked the guy who gave me this stuff if he knows something about it,
apparently he just recalls that a company that went out of business during
the late 80's sold them (used) for about $25 (ATARI-400 + a SideWriter
keyboard)...

As soon as I have more details I'll be happy to post them is there is an
interest.

Thanks,
Ronen

1320. Jupiter Mission 1999 HELP

Newsgroup: comp.sys.atari.8bit
Date: 2000-02-21 00:00:00 UTC
From: Linda Shippert <loo@u.washington.edu>
Message-ID: <Pine.OSF.4.10.10002211252110.1628-100000@becker2.u.washington.edu>

I've been slogging through Jupiter Mission 1999 and I think I'm stuck.

I've made it past the asteroid field, repaired the ship, launched the probes and found the signals on Callisto and Ganymede. The computer suggests I set a course to Callisto but every time I set a burn angle and run the simulation, I always just get pulled into Jupiter.

Is there some kid of trick to making the burn to Callisto? Am I missing something? Help!

It is usually a bit more complicated than that...

Many failures show up as writing a physical memory location from two or more logical addresses - like $4000 in bank $3 is the same location in bank $B. To see something like this you need to write the logical address into each physical location and then read them all back and compare.

Lots of failures can be attributed to refresh problems or timing skew and stuff like that.

And, you get software issues thrown in just for fun....

Makes writing a diagnostic a big job.

Bob

Just acquired USDoubled 1050 and Indus case full of miscellaneous disks; one is in double density and contains DOS.SYS & DUP.SYS for Atari DOS 2.0S(?). The disk boots fine to the 2.0S DUP menu but will not read single density on the 1050 (which will normally auto detect density) nor on D2: 810. Booting with standard 2.0S or 2.5 will not read it, which was as expected.

I can easily access and manipulate the files with TopDOS or MyDOS, BUT the question is: HOW did they make the DD disk, write the .SYS files, and transfer SD stuff to or from it?

Not really critical now, just puzzling!

1332. Need help to repair a 400

Newsgroup: comp.sys.atari.8bit
Date: 2000-02-22 00:00:00 UTC
From: Mike <changm@arvotek.net>
Message-ID: <38B31969.3C130B3E@arvotek.net>
Source record: 46399

Hi all,

Still have this 400 in my basement. I took it apart and checked for
cold solder joints and such and it seems fine but does not work.
I stick in a cart and the screen goes black but nothing else, take it
out
and the screen goes back to neutral. I know this is due to the cart door

and the switch there. Basically, is there a repair guide I can look at ?

The 400 is in great shape but it won't come up. I cleaned the cart
slot,
the power light is on, the cart is good.

I read somewhere you can blow the 'U-1' chip. Can this be the problem ?
Thanks,
-Mike

A 'DOS compatible' printer is one that will print out whatever
ascii you send to it, using only a 'standard' cable handshake.

That is 1 Byte. What is wrong with using 2 or more bytes for bank
switching??????????
$D5xx has 256 Bytes to play with. No reason why all cannot be used to
switch banks. The hardware required would be the bigger limiting
factor.

Hi all,

I am surprised and happy to hear that people are still using my software in the age of cable modems and graphical WWW access... :)

I wanted to post a little reminder to those of you who are using Ice-T and are not registered (I've received a respectable amount of registrations to date; However, I still believe these are only a small portion of the users). Writing this program took up most of my nights as an adolescent (I was 13 when I started.. 18 when I put out the current version, and 21 now :) and literally represents thousands of hours of work.

While I am still offering this software for free, I still request that anyone using it on a normal basis, registers it. $25 is a small price to ask for this program.

Thank you, and keep enjoying Ice-T!

Source record: 46402

Hello all,

I may be moving in a few months, and it's time to clear out some unneeded items.

Despite the fact that I live in Israel, most of these items were purchased in the USA and therefore conform to US standards (NTSC video, 110 volts, etc). If the item doesn't say PAL or Europe, it's for US users.

Power supplies can be included if you're willing to pay the extra shipping price.

Generally, sending parcels overseas is relatively cheap from here (esp. with surface mail).

Just make me an offer, and remember buyer pays shipping.

My email address is at the bottom of this message. You can NOT reply to me by hitting the Reply button!

- High power AC/AC adapter. 220VAC in, 9VAC out. Good for Atari 400, 800, 1200XL, Rana 1000 drives, anything that needs 9VAC. For European users.

- Atari 800, 48K, non-working (green screen of death). Last time I checked it did work intermittetly after a good few minutes of being on. I guess it's a small repair.

- Atari 1200XL, working BUT a few keys don't work, and I installed a video upgrade that didn't help very much..

- Atari 800XL, PAL VERSION, fully functional.

- Green-only 13" monitor. Excellent for 80-column work (Ice-T was written on it..). This is quite heavy so shipping might get costly.

- 14" American-standards Color television set. It's old, but it works, 13 channels plus UHF. Nothing I can do with it in Israel.. Also quite a bit heavy.

(NOTE: I am willing to get rid of the TV/monitor for just the shipping price - I don't want to throw them away!)

- Supramodem 2400 + manual. I'll throw in a cable that lets you attach it to an APE/Sio2PC cable (so you don't need an interface).

- Disk drives: Indus GT, Rana 1000, worked last time I checked.. May need dusting :)

- Atari 850 interface, includes manual (!).

- Atari 410 tape drive, non-working.

- Ancient Atari 2600 cartridges: Defender, Combat (PAL), Circus Atari (PAL).

- Miscellaneous joysticks, cables, adapters, power supplies in various states. EVERYTHING MUST GO!! BWAHAHAHAhahahaa :)

I also have quite a library of books and some esoteric manuals.. Feel free to ask about these.

Since I haven't clarified this....

Buyers of the cartridge, when it is released, need not register Ice-T. The cart version won't nag you about paying the author nor about supporting 8-bit software. :)

Those who use Ice-T will then be requested to either buy the cartridge, OR register by paying me directly.

Help! I'm trying to find a manual for the XE Game System (an online version would be fine.) Have scoured several web sites with no luck...

My specific problem is trying to get cassettes to load. Whenever I try the power on method used with the 800, I get a "boot error" message a few seconds after the data starts being transmitted.

You should use the same method. OPTION and START while powering up for most commercial games. Problem might be if you use a XC-12 tape recorder. They are really bad. I tested these for a company here in Norway and of the 200, I guess about 90 were defective. Try adjusting the heads, see if the ground cable is properly connected to the heads. Also try to rewind the tape fully, then forward some 4 to 6 steps on the counter.

>gaming company? Debatable. I tend to side with Hasbro proponents since I
>like a couple of their titles.

Uridium to Last Starfighter. There was rehashed. At least Hasbro isn't in
the Mindscape state of mind. A Marginal thumbs up for Hasbro? Still, where
are the rallying games that you anticipate? Where are the pokemon, cabbge
patch, barbie, or Star Wars rushes for new games? Where are the games that
are worthy of the hype?

>> It's too late to remove the "ergonomically planned" claim from the
>> ProController packaging, but please explain your discomfort.
>
>I have small hands and the controller was unweildy for me. Here we get into
>opinion, so I'll stop pursuing that point.

Okay. I can see small hands being a problem. Personally, after playing the
Jaguar, PlayStation controls seem awkwardly small...

>A popular gaming magazine actually brought that to my attnetion. THe CD
>drive sitting on top of a Jag looks sort of like a toilet with the lid
down.

I thought it was something like that. It's not the first time I've heard it.
I pictured the Jaguar + CD design more along the lines of Star Trek: The
Next Generation's Enterprise ship that seperates...

I did notice taht it's not designed for left handed people, too.

>Secondly, I have to bow to the reference that certain games work better on
a

>Jag than a PSX. FOr some reason the PSX hase very few 2D scrollers or
>shooters - a genre that I like. Aero Fighters, 1943, Raiden, - those are
the
>games I like. Yes, some of those are on PSX but the Jag has some very
>interesting offerings, too. And have you seen Tempest on both systems? The
>PSX version comes nowhere near the Jag version.

I have not seen other versions, but I did read an interview with Jeff
stating that his favorite version was the Jaguar's. Isn't that a good
recommendation?

>But I still stand by my original statement that the PSX is more powerful
>overall. And the PSX 2 has specs that show that it can do more operations
>per second than the Cray Supercomputer. It doesn't come with built-in seats
>and it looks more like a brick than the PSX1.

32-Bit graphics will always travel much faster given approximately the same
power. Too bad, the seams show and the objects become lost in other sprites.
If the programmers could spell and the errors weren't so obvious, I'd still
play the PlayStation more than the Jaguar. It had it's chance. It didn't pan
out.

>Thanks for the link, I will use it. And yes, fogging and transparency WERE
>used on the Jag - every time Atari Corp tried to compare it to systems like
>the Saturn, N64, and PSX they used transparent lies and tried to fog the
>issues at hand. I remember some really heated interviews in my gaming
mags.

Try the developer section of Just Claws. That appears to be where I read the
transparency and fogging issues there.

>Wish I still had those available to quote. The whole time the Jag was the
>only power machine on the block, Atari sat on their hands - and when the
PSX
>and N64 started getting all the positive press, they began making
>exaggerated claims about the system's power.

Darn, gotta go.
The Macs you refer to below are economy entry level macs. There are
comparable systems for IBM. Zip drives are out when you have an Optical
Drive from your old system. (My old drive cost the same as a current IMac.)
I can't tell you how many usres probably asked for Zip to be taken off their
systems, but I'm one of 'em.

Both work great on the Atari800 emulator :

http://cas3.zlin.vutbr.cz/~stehlik/a800.htm

There are a number of other emulators as well. I was going to point you
towards emulators.atari.org, but that link has been down for some time.
Anyone has some info?

Check also the Emulator FAQ at :

Why disturbing? I'm playing Alternate Reality (Atari 8bit version) even as I type. Some games never lose their edge. For a game to be popular 15 years after it stopped being distributed is quite a feat. It's really a tribute to Dani that the game still has legs...

COMPUTE! was one I read. You can peruse back issues of COMPUTE! in a
lot of public libraries. I remember devouring the articles and ads in
those magazines. Artworx was a company that I remember putting out
crappy BASIC programs that looked great in the advertisement.

some programs require that you turn on your computer first,then type in the command "cload" then hit return to start loading, others you may have to hold down the start button, turn on your machine, wait for a beep,then release the start button, then hit return on your computer to start loading, some i have had luck with holding down the start button,and the option button at the same time,then turn on your computer, listen for the beep,release the start button,then the option button,then hit return.
some may never load,i use my tranlator cart on tough ones,but there are some that just will not go,thanks,
lance

Body handling: HTML body converted to readable text

For faster service, Please direct all replies through E-Mail to Ben at: atari@benjamin.net or bensmith@teleport.com instead of NewsGroups as I find it hard to keep up with NewsGroups.

FREE Catalogs for Classic Atari 8 Bit & Atari ST Computers! Hard-Ware, SoftWare, Books & Accessories! View Atari Catalogs on the Web at http://www.atari.benjamin.net And Jump to my FTP site linked to my Web Site so you can Download Free Catalogs or FTP directly to my site at: ftp.teleport.com/vendors/bensmith/ If you can't get Catalogs that way, Feel free to Request catalogs through E-Mail. Really, it's not an inconvenience. I do ask that you specify Atari 8 Bit, Atari ST or Both! Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail. Please let me know if I can attach text files to your E-Mail. Catalogs are just regular ASCII text files so you can download them into your text editor and view them, edit them or print them out! It would make things easier for me if you take my Catalogs, load them into your text editor, delete what you don't want and E-Mail me the rest! To expedite things, include your complete Mailing address so I can figure your Shipping/Postage & Handling. I'll be back after the weekend.

e-mail: atari@benjamin.net

I've added more and will be adding more Hardware, Software, Books and Accessories for Classic 8 Bit and Atari ST. So checkout what's new on my WebSite. In Fact, check it regularly as my Catalogs are updated regularly. Customer's are served, first come, first serve! I have 6 different Catalogs, and my SoftWare Catalogs are my largest. They have the biggest Byte Count. You should see my inventory! I have TruckLoads of HardWare, Boxes & Boxes of Software & Libraries of Books & Reference Material for the Classic Atari 8 Bit & Atari ST! And remember, if you can't come see me today, come see me tomorrow!

Click for WebSite!

The DOS version is superb but I would recommend the Windows version hands
down.

Speaking of which, I wonder if Rich has any plans for it?

Here's hoping.. :)

From: Jose Olivera Jr <ace942@gate.net>
Message-ID: <38B74914.30D5EF13@gate.net>
Source record: 46435

There is a free Atari 8-bit emulator at http://www.emulators.com. It was originally commercial but now the program has made it available for free. It will probably not be updated since the programmer does not feel that there is a market left for the Atari 8-bit but given the number of years that has been spent on this project, it is extremely stable and not likely to need any updates.

There is also a free Atari ST emulator available there too but you will need a TOS rom image to get it to work.

Yes your right on that one. In fact, John tailored these systems to
airports. I believe
he said he did the system at a airport in Hawaii (Honolulu maybe?) at the CGE
99 show.

He even went as far as to design a new 8bit system to market with his
software, but just
didn't quite have the market for it. He said it was getting hard for him to
find surplus XE/XL
machines.

It would be interesting to know what airports have these systems?

Last Updated 02/26/2000
- Sold/Traded Items Removed

I have the following Atari 5200 items for sale or trade. All units are fully functional, cleaned and detailed, and in good or better condition. If you have any questions in regards to unit, box, or label condition, please feel free to ask.

All prices quoted are in U.S. funds with the buyer paying shipping. For items that I am taking offers on (no price listed), please make all offers in U.S. funds. I am also willing to trade for certain items, please see my list at the end of this post.

If you are interested in any of these items, please use this link to contact me jim_l@NOSPAM.telusplanet.net?subject=Classics.Atari.5200 (removing the NOSPAM first). Or email me if you would like a current listing of items I have for other systems (Atari 2600/5200/7800/Jaguar, Colecovision, Intellivision, Classic Computers (Vic 20/C64/ADAM/Atari/TI 99/4A), Vectrex, Microvision, or Handheld games) sent to you, (please specify system).

This list covers the following Atari categories:
- Controllers
- Shrink-wrapped/New Games
- Multicarts
- Atari Force Comics

Controllers for Atari 5200 & Computer Units
==========
These controllers are intended to use the standard Atari plugs, and require an adapter to work on the 5200.
- 2x Suncom Tac Joysticks $10 for the pair
- 1x Spectravideo Joystick with suction cup base

** Atari 5200 Titles - New/Shrink-wrapped**
==========
- Ballblazer by Atari/Lucasfilm $20
- Pitfall by Activision $15
- Rescue on Fractalus by Atari/Lucasfilm $25
- River Raid by Activision $10
- Space Shuttle by Activision $12
- Zone Ranger by Activision $10

Multicart Cartridges
==========
- Atari 5200 Multicart $125 - Contains all of the released 5200 game titles as well as demos and the 5200 diagnostic cart. Game selection is done by using DIP switches.

Atari Force Comics Please make an offer
==========
All are in Mint Condition
- Issue #2 - February 84
- Issue #3 - March 84
- Issue #11 - November 84

Electronic Games Magazine memorabilia Please make an offer
==========
-Order Form Insert (Vectrex Version) - Mint Condition. This was the original full color order form insert that was packaged in with many companies cartridges to help promote sales of 'Electronic Games' magazine. It is a three page foldout which covers all the regular articles that 'Electronics Games' ran. The front cover is purple and offers Vectrex players a 44% discount.

Trades
==========
I am also willing to trade for rare or shrink-wrapped/sealed titles for...
- Intellivision, Colecovision, Vectrex or various Atari systems
- Shrink-wrapped Intellivision NHL Hockey or PGA Golf
- Shrink-wrapped or mint SEARS Telegames for the Intellivision
- Shrink-wrapped or mint DigiPlay games for the Intellivision
- Shrink-wrapped or mint Intellivision Tutankhman, Super Cobra or Popeye
- Intellivision Congo Bongo, Draughts, Triple Challenge and Fathom
- Rarer Mattel and Coleco Handhelds (a list is available upon request).
- A complete brown variation of the Intellivision ECS
- A World Book Tutorvision (Intellivision III Clone)
- A complete Atari Jaguar CD Unit or Jaguar Accessories
- Atari Jaguar Games
- A working Vectrex controller
- A working SONY SAT-A50 Satellite Receiver
- Working DSS H or HU Cards
- And of course the ever popular, original Intellivision keyboard (should I be so lucky :).

> been able to use Ultra Speed/Warp Speed?

I have.. But, you need to ensure two things:

First, that the real disk drive isnt using the same drive number as an
APE/SIO2PC drive
Second, if #1 is true, power off real disk drive.

Works fine for me..

1384. 1050 died - U7 chip the culprit?

Newsgroup: comp.sys.atari.8bit
Date: 2000-02-26 00:00:00 UTC
From: Mark Milbourne <milbourn@usit.net>
Message-ID: <38B866A0.A28E7A4F@usit.net>
Source record: 46352

A while ago I posted asking for help with my dead 1050. Thanks to
several that responded with good advice and somebody that had a SAMS
service manual that scanned and e-mailed me copies.

Can anyone out there with 1050 service experience confirm my hypothesis
before I go spend money on replacment parts:

I believe I have a partially bad U7 chip (the 6532 PIA). Is this chip
a common failure point in the 1050? It is the first chip that the SAMS
manual suggests to swap out for this category of problem.

Symptoms:
On powerup the drive motor does the normal brief spin and the head does
it's little 1/4" out and back which I understand is also normal.

On inserting a disk it also spins the motor briefly which seems to be
normal.

The drive does not make any response to the computer being powered up.

Checks done:
The IO lines come through the U1 chip (a bank of about 5 transistors).
I have verified, best I can, that these are all still working.

The incoming "hello" from the computer turning on can be seen as a brief
burst of pulses on the logic probe at the output of U1 and the input to
U7 (pin 17). Likewise the Command and Ready lines are working through
U1 and pulling their pins low on U7 when the computer is powered on.

The CPU seems to be working because it is doing the normal power on and
disk insertion prespins and spot checks with the logic probe show the
address and data lines to be actively pulsing.

However, there is never any response to the computer. The data out pin
on U7 (24) stays high when the computer is powered on. No pulses
whatsoever on the probe.

So best I can tell, the data in or out portion of U7 is probably fried.
But I've never messed with a 1050 before and wanted to see if anyone
with experience could confirm this or suggest checks that I've missed.

All the voltages and other preliminary checks in the SAMS service info
check out except that the 10V on J1/pin1 when the drive motor is off
seems to be dead wrong - checks as zero and has to be at least very low
- otherwise motor would spin faster than normal 7V "on" and busy LED
would stay lit.

Background: The computer and drive were resurrected after half a dozen years or more in storage and then used for a couple months until the failure. The failure occured after a week or more of leaving the computer on all the time to play a couple levels of Lode Runner each day. In between, I'd turn off the TV and I think often I powered the drive off as well. One day after playing the current level, it never came to life to load the next and has been dead since.

Please reply by e-mail.

Thanks

The Maverick themaverick@volcano.net said:

>command "cload" then hit return to start loading
>
>I tried this after the "boot error" message was received, but received an
Error 21

Yep #21 means NOT a BASIC load file which could be "CLOAD"ed; #138 (timeout) or
139 (not acknowledge) are more common with the cassette & SIO.

-Ron

I don't have a solution but I admire the problem.

I'm having a similar experience with my XE lightgun, but this is consistent with what I've read about them. I've heard that the Best Electronics lightgun is better (anyone have hands-on experience?)

I've also converted a Sega Master System lightgun for Atari use. The instructions came from an old Antic article posted at the Atari Gaming Headquarters (http://www.atarihq.com/atcomp/xegs.html.) I haven't tried it on my XE yet, but it works great on my Atari 7800!

(quoter turned off to save space.)
Lemme see, Ken Miller has trouble with roms in 'Win xl-it v.03'.
Never heard of that one. I thought xlit .2 was the last from that guy,
bad memory on his name. Ahh Marcus Gietzen and Ron Fries.
Mr. Irvin asks why not use atari800win from Firth and the people
who have been updating it. Ok, so I found atari800win 2.5 I think it
is. And I still prefer xlit .2.
1. my 486 dx4 120 is too slow for the 800win version.
2. I spent an hour or so trying to get used to 800win and I'm just used to
xlit.
3. 800win doesn't support a pc joystick. Now, most things people want
to do on an emulator requires a joystick, and keyboard just doesn't
cut it.
4. I still can't run SpartaDOS, my DOS of choice, even on an emulator.
I tried enable RAM under OS and that didn't seem to get SpDOS to work.

Regards
Russg

>I have never been able to get SIO2PC or APE -and- a real SIO floppy drive to work on my systems at the same time. <

Well, I whacked out all the caps attached to the SIO pins in my 130XE. Made no difference in using a real drive with an APE cable in the circuit at the same time. The real drive could still read with difficulty, but could not write. Ok, more components for the interface...

Hello all, I just wanted to tell you all about this great magazine I've discovered. It's great to finally have a magazine that actually concentrates on the good ol days of videogaming. I encourage all of you to check out their website at www.classicgamer.com. I am in no way connected with the mag, but I just wanted to share my discovery with you all.

1395. 8-bit price list

Newsgroup: comp.sys.atari.8bit
Date: 2000-02-27 00:00:00 UTC
From: Gregory George <greggeorge@att.net>
Message-ID: <38B8AD59.6E483EC4@att.net>
Source record: 46356

I haven't seen a FAQ in the newsgroup for this so, I'd appreciate it if
you could point me to it.

Anyway, I recently acquired a bunch of 8-bit cart games from a co-worker
who also gave me his XEGS (with lightgun) and modified 400 (with real
keyboard and extra RAM!) . Is there a rarity list for Atari 8-bit
computer games? I have no intention of selling any of these, but I'm
just curious to know if any of these could be considered to be a
"grail."

K-Razy Antiks
K-Razy Shootout
Boulders and Bombs
Peanut Butter Panic
Gorf
Journey to the Planets
Pit Stop
Jumpman Jr. (I think. No label and it doesn't seem to work now.)
Bug Hunt (XEGS)
David's Midnight Magic (XEGS)
River Raid
Pitfall
Miner 2049er

And the one *I think* may be rare:

Bounty Bob Strikes Back!

Thanks,

--
Greg

1397. Re: Drive 9

Newsgroup: comp.sys.atari.8bit
Date: 2000-02-27 00:00:00 UTC
From: Rick D <74766.1561@CompuServe.COM>
Message-ID: <89ahdq$6p4$1@ssauraaa-i-1.production.compuserve.com>
Source record: 46358

What would I do with 9 drives? My Mydos 4.5.1M system has real 4 drives now- 2 @ 360K, 1 @ 1 meg, and 1 1050. It also has a 256K or 1 meg ramdisk as d8:(since more software supports this number). I also have made use of d7: using Omniview to create a second ramdisk for "j" duplicating disks. And I recall having a "patch" that would let me redirect any other D# to any path on any existing drive. That was a long time ago. I needed to do this for software development and disk library management/copying.

1398. Re: Memory Expansion Testing

Newsgroup: comp.sys.atari.8bit
Date: 2000-02-27 00:00:00 UTC
From: Rick D <74766.1561@CompuServe.COM>
Message-ID: <89ai59$6p4$2@ssauraaa-i-1.production.compuserve.com>
Source record: 46359

My tried and true method for testing memory expansions is to copy
a big text file to it as D#:, then copy all of it to the screen.
If anything is whacked, there is a problem. scrambled chars
usually mean a bad bit or connection. Repeating sections meana
bad address connection or the page bytes are corrupted(I did that
once). If this first page is o.k., I then proceed to copy all of
the files into the sam ramdisk as another name, with append,
until I fill it up. If it doesn't crash-great. I then delete
all of the files except the last one, again expecting it to pass,
then recopy everything to fill up the rd again. Copy all of it
to the screen to check for lockups, several times.

This works for me.

Source record: 46361

Its very easy to destroy those tiny traces, the top was the worst place to put them. The problem could also be shorts in the solder up. Also, most holes are thru and must be soldered on both sides.

My method for large chips is to remove the old chip by solder wick and solder sucking, heat each pin and wiggle with tweezers, then lift the old chip off. Clean up the traces with a solder sucker. Check the traces to make sure they are complete, and the thru holes connect. For anything missing, I use a small piece of wire, thru the hole if needed. Only after I'm sure the chip area is good do I put in the socket.

For small chips, I have a homemade tool that I heat over the stove, then apply to all pins at once with the board clamped down. I can usually yank the chip out clean, then go to inspect and repair as needed.

If I don't want to save the old chip, I use flat clippers to cut the pins, remove the chip, then unsolder the pins.

Greg,

I'll offer $10 for Bounty Bob :>))). Seriously, it is a rare cart and would bring in a nice price. Check cart rarity in Andrew Krieg's cart list:

http://www.execpc.com/~krieg/links/8bit.carts

My experience is that C (common) and U (uncommon) carts are often under $10. R (rare) carts are about $5 to $10 more. ER (extemely rare) can be any price. Keep in mind I am talking about loose carts and the list is not always correct in the rarity ratings.

Yes, you need sio2pc (Nick Kennedy) or APE cable (Steve Tucker.)
Both come with free software, the APE shareware version, unregistered
is slightly crippled, but still quite functional.
Uhm.. I forget which direction APE unregistered is hampered, seems like
it was the other direction, moving stuff from A8 to pc.
Russg

(Mr. Irvin responds. Quoter turned off, and memory (mine) not so hot.)
I'm still trying to figure what to do with my old XT.
(Mr. Irvin mentions limitations with my 486 120 mhz.)
I can't play modern PC games. Other than that, I do most what I want
to do. It'll run Chess Master 7000, even the internet connection parts.
(Mr. Irvin says A800 DOS or Win supports PC joystick).
I re-read the docs (again my memory doesn't hold up so good.)
The part where it said no joystick was for Win NT, I guess.
I couldn't/didn't get my joystick working when I tried it, but I guess
it (pc joystick support) must be there if you say so. The doc said some
thing about needing Direct X (I think I have) and Direct Input (don't
have, I think.)
Someone said that they got Sparta 3.2g to work on the DOS version
of A800. My 3.2d .atr wouldn't work when I tried the Win version.

So, Thanks. About all I use the xlit for is Sargon III and occasionally
a game or so. Maybe I'll try the DOS version of A800.

Care to mention some specifics on the advantage of A800 DOS and Win?

Regards,
Russg

Source record: 46367

(Me babbling on.)
Nobody here had a vested interest in any of the excellent emulators.
I'm not putting down Atari800 win or dos.
Ken Miller, the guy who started the thread, hasn't commented.
I guess he got his answer in e-mail and moved on.
I downloaded .9.9 for DOS. I already had it in my files, actually,
along with .9.7.
There's no cure for my slow machine (it was plenty fast 5 years ago).
I tried my Sargon III on it. The joystick works, don't know why I
thought it didn't work, maybe something to do with the Windows 2.5
version.
The top of my screen (about the top 5%) gets cut off.
XLit has ways to adjust the frame rate for older slower machines,
you can make it go as fast as you want, ridiculously fast on even
an old machine like mine.
XLit also has video options to let you fix video display problems from
within the program. I picked NTSC in the config for A800 DOS,
maybe that was my mistake.
Thanks for listening.
Russg

Hey, Rodrigo!

We're not in a music newsgroup, but Yngwie is not a god. Don't tell him that. Malmsteen is not a good person to quote... not that Kirk is the best.

As for the Hasbro thing, they aren't in the business of video games, either. They are marketing and they should stick to board games and action figures. Normally people learn how to fully use one machine before improving upon it. Instead, with computers, more power and faster processors are all we're seeing. I'd rather see Atari come back. Not Hasbro's Atari. Hasbro's doing nothing new. Atari always did. Until they do, they should not use the Atari name.

I wanted to touch on the iMac Mouse opinion. Mac and IBM don't need a mouse unless you have hitboxes. There are quick commands, or shortcuts, that you can use for most programs including the operating systems. You can hit the first letter of a file and the alphabetical first file will be highlighted. On Mac you can actualy put in the first three letters (or more?) of a file, but on IBM it generally only lets you jump to the first alphabetical letter. Then, you can use arrow keys, up and down, to select the file you're searching for. You also have the TAB key to toggle through entry blocks, open-apple + v to paste, open-apple + x to cut, open-apple + O to open a file, and so on. This is the same as ctrl + V and ctrl + X on IBMs. When complaints about Mac having one button come up, it's funny because whenever

you use the Mac mouse, you're not being efficient... unless you have hitboxes or bullet buttons. In short, don't use the mouse whenever possible. Use keyboard shortcuts and you'll save time.

If you have an IBM emulator on your Mac, there are two button mice you can purchase for your Mac. Why you need two button mice when you have a keyboard is probably more for ease-of-use than speed or functionality.

As I was collecting my Atari 7800 games, Jaguars, learning how to program, and finding prospective Jaguar Developer System sellers, it seems that Mac has come out with OS 9 (actually talking about system 10) and IBM has Windows 2000 for businesses. (incompatible with all old software) How much time has passed since Mac's OS 8.1? They didn't used to update their operating system this much, did they? They never had to before the Mac Power PC.

With meddlesome charm,
MegaData

Atari Dos 2.0 will read and write single- or double-density disks, but it will not sense and/or change a drive's density. When I had the Astra Big-D drive, I could make drive 2: double density with TopDos or MyDos, then reboot the computer with Dos 2.0. The second drive would remain in double density, so if you then formatted a disk in the drive and copied the .sys files to it (with the "H" command), you would have what you have described: a double-density disk with Atari Dos 2.0 on it. Booting with either a single- or double-density 2.0 disk will not allow you to read enhanced-density disks, and as you mentioned, Dos 2.5 will not read double-density disks created by anyone's Dos!

BTW, you can create a double-sided, but single-density, disk with MyDos. I even found a use for this oddity. I used to use Home Accountant. Since it used "Note" and "Point" to find and save data, it wouldn't work with anything but a 128-byte sector. But it did work with the DS-SD disks!

That machine is a good enough one for basic Internet stuff. It'll run Netscape 4 (use just the browser, not the Communicator). It is certainly good enough to run an Atari emulator.

>Someone said that they got Sparta 3.2g to work on the DOS version
>of A800. My 3.2d .atr wouldn't work when I tried the Win version.

>Care to mention some specifics on the advantage of A800 DOS and Win?

What is out there now are more or less complete emulators. I saw a website that commented on XL-it that Markus Gietzen was not updating it. But that overlooks the fact that XL-it does pretty much everything already.

There are other complete emulators out there as well so the people advocating one or the other are expressing their personal preferences, not that one runs 800 software better than the other or anything.

The advantage of A800 Win over A800 DOS is probably (haven't tried them) ease-of-use.

I certainly think any of the emulators would run Sparta DOS. A DOS does not bend the hardware or attempt to stretch the capability of the machine as you might see some advanced game doing. I think you are having some configuration problem or you have a bad ATR.

Speaking of Big-D's... doesn't the Astra BigD have one single-sided drive
and a second double sided drive? (Iwas just wondering... I have one stashed
around here somewhere).

Lets try the simple things first. is the drive number switches in the
right position and are they working?? sounds a lot like they aren't.

That would be PC Xformer. I tried that emulator once to see how it
would play Donkey Kong and it was "so" bad I laughed my butt off. And
the ST version is even worse since all it's good for is running
occasional BASIC programs. You can use Xformer and the special cable
to transfer files from a 8-bit drive but then again APE/SIO2PC is more
efficent.

Trust me, you're much better off using Atari800 for Linux or even
Windows (the best port yet) :)

Hello Maverick,
we tried the Sega Lightgun too and the following happened:
- Atari LG works "good" with TV, does not work at all with monitors (we tested Philips and Commodore)
- Sega LG works "great" with TV and also with monitors (Philips and Commodore)
- Best LG yet unknown
So it looks like it is worth converting a Sega LG, maybe someone knows a little more about the Best LG... greetings - Andreas

Message-ID: <38b914dc02_rau@cnx.com>
Source record: 46380

AM>Atari developed quite unpopular DOS 3, it used 1k per
AM>sector/block. Maybe there is a posibility to get DOS 3 working with a
AM>harddisk and up to 65535 sectors/blocks (a 1kbyte).

No. DOS 3 used internal conversions to logically translate 8 128-byte sectors into a 1K "block." It never used true 1K sectors. I have to wonder how (without hardware translation) an 8-bit DOS would ever use 512 or 1K byte sectors. (I know the Black Box did it in hardware, breaking the 512 byte sectors into two 256 byte sectors.)

And (I'm going to sound like a heretic here, but) why would an Atari need more than 16MB in a partition? :)

-!-
* BM 0.8 * I parked my harddisk - now I can't find it!

From: Jon-Paul <pockets@cix.co.uk>
Message-ID: <38BAB9A8.1B1490C0@cix.co.uk>
Source record: 46381

is there any problems involved in using us issue carts with a uk spec
machine?
note this is in reference to 800/xl/xe machines.
i seem to remember there was a problem with specific carts and programs
due to particular graphix modes rather than a generality beacause the
machine could (note the term could) convert the signal.

sorry I used to be an 800xl owner and are about to become so again so i
am checking sources for kit/games/parts.

yours, Jon-Paul

Actually Chicago Windows (as well as 3.11) has it's own DOS built in.That's why
MS-DOS programmes can only use long file names while Windows is running.It
catches $21 interupts (among others) and handles anything DOS-related.
(so time/date function calls get passed on to MS-DOS)
```

Well I never use plain DOS but I use MS-DOS to play IBM games,of course.
Of course any Windows (Win16,not Chicago) programmes you run use MS-DOS.
(I don't think that plain DOS would work with Windows/Chicago)

Hi, I have never had a problem with a US cart to date, although some colours are sometimes a little "strange". I don't think a lot of cartridges were converted for PAL. Most cart problems I have found are dirty connectors and also the old 400/800 / XL/XE differences with some early carts.

Not so! The Sparta3.2g ATR boots fine in A800DOS and NOT in any of the others (XFormer, XL-it, XFormer2000, A800Win); on at least some of them, I think it is the RAM under the OS part that glitches... XFormer is also the only emulator I have that will boot DD MyDOS453 XFD?

Absolutely, at least almost... the DUP menu indicates "2.0S"; don't have a quick & easy way to do a byte to byte comparison of the stock 2.0S DOS & DUP files? Pokes before you write .SYS files can alter it or a sector editor can make it say "9.4X" for that matter!

-Ron

I don't have a solution but I admire the problem.

1433. Late News/Good News/Prosys cable

Newsgroup: comp.sys.atari.8bit
Date: 2000-02-28 00:00:00 UTC
From: Richard Cortese <ricortes@netmagic.net>
Message-ID: <sblstc75jp146@corp.supernews.com>
Source record: 46392

Took me a bit longer then expected, but I finally got the voltage measurements from a Prosys cable.

The good news is, I had a couple of 1489's laying around in addition to the 14C89s. I decided to try one out, and sure enough it worked w/o so much as a burp.

I did use a 10 mF cap on the thing vs .1, parts drawer thing. It shouldn't make a difference in any circumstance.

The voltage numbers, [pin, 1489, 14C89]
1 -10 -10
2 -.6 0.0
3 3.3 6.3
4 -10 -10
5 -.6 0.0
6 3.3 6.3
7 0.0 0.0
8 .18 0.0
9 .72 0.0
10 1.7 2.8 => 5.6k pull up may be borderline for 1489
11 3.2 6.3
12 .14 0.0
13 .14 0.0
14 3.2 6.3

The other thing I did was NOT tie pin 13 to ground. I reread the RS232 specs and data sheets and found it was not necessary. Open pin is tied on chip/silicon to represent a logic level vs float.

I did one other design, this was before I even realized/measured voltage levels. I wired the zener across pins 7 and 14 and fed it with a 300 Ohm resistor. I didn't bother to measure this one, but I would suspect it would operate much closer to +5V then the current design. That is, the 1489 will get closer to 5V from below, while the 14C89 will drop to 5.1V from the 6.3V I am seeing now.
IMO: Don't worry about this one since the 1050 and 810 use transistors to buffer the data lines, you would have to do something really radical, like exceed the breakdown voltage for the the transistor before you get a problem.

I'm not going to put this info up on my web page, but as with anything I do, I consider it PD. Post it freely and no need to attribute it.

very true, but it isn't done in hardware. the bb rom reads in the
whole 512 bytes and stores it in 2 pages in it's internal ram. The
required 256 bytes is transfered to computer ram. If the nextsector
required is in ram, the transfer will be very quick. Generally, the
drive formatted with 512 byte sectors will be faster reading.
Writing however is a different story. First, the required 512 byte
sector is read, the 256 byte half is changed and the whole 512 byte
sector is written out again.
As you can see, writing will take longer with 512 byte sectors.

>Well I never use plain DOS but I use MS-DOS to play IBM games,of course.

Somewhat off-topic for the groups, but I'll answer it anyway...

Yes, DOS is not used too much on the average user's desktop anymore,
although for some specialized instances it's still the better choice. (As
has been pointed out, many older games run better in a "pure" DOS
environment than in a Win9x DOS box.)

However - DOS is still _very_ big in the embedded-systems market; i.e.
small computers (typically 386 or 486 systems crammed onto a board about
the size of a stack of 3 ZIP discs) that are sealed up inside a box.
Industrial automation, scientific instruments, gas pumps... you'd be
surprised how many things out there are still running DOS; you just don't
see them running it because they don't _look_ like PC's.

BREAK UP MICROSOFT!!
(Preferably with a wrecking ball and some dynamite.)

Hello again group. Actually I have not been able to get back online since I posted the question. I appreciate all the emails and the replies on here. I have several of the emulators downloaded, I guess I need it explained to me like a 2 year old. I have the roms (at least I think I do) but I still can not get the games to run at all.

You can also transfer disks using a 5 1/4 drive on your PC. I use a
program called "ataridsk" to accomplish this. I've been successfully
transferring disks to and from my 8-bit systems to run on Atari800win.

This is some cool stuff here...

|CATOLOGIC RELEASES THE LONG AWAITED BATTLESPHERE(tm) FOR
| JAGUAR AND DONATES ALL PROFITS TO DIABETES RESEARCH
|
|
| February 29, 2000
|
| For immediate release:
|
| CAPITOLA, CA -- Scatologic Inc. is pleased to announce
|that the long awaited BattleSphere(tm) for the Atari Jaguar platform
|will soon ship, and that all |profits from the game will be donated
|to diabetes research.

We still have a month to go till April 1st, so I guess we can rule
out the April Fool's day gag. :)
(I think I said a while back on a Newton list serve to never
release a product on April 1st... if you are serious.) (grin)

| BattleSphere(tm) is the awesome full 3D networked
|action shooter for the Atari Jaguar. The game was developed by
|renowned Jaguar, NUON, PSX2 and PC developer 4Play, which recently
|merged with Scatologic Inc. to form the newest industry powerhouse
|development team.

Any chance we will see this on the NUON ?

| The highly anticipated BattleSphere(tm) combines the
|fast-action gameplay of a first person shooter with the nonlinear
|aspects of a strategic campaign simulator. Also included on the same
|cartridge are several additional play variations which range from a
|pure classic arcade action game to a multi-player networked
|deathmatch mode, where up to 32 players can dogfight for control of
|the Universe. The game garnered acclaim from players when it was
|demonstrated at the World Of Atari show in 1998, and it has received
|glowing praise from industry leading publications like Next
|Generation Magazine and Diehard Gamefan magazine.

Can we say "Star Raiders"? :) Can't think of any other platform I
would rather play a Star Raiders style game on this side of an Atari
400. (grin)
Now we just need to get this style game for the Lynx and 7800 and
we'll have it covered. Panther is optional. :)

| BattleSphere(tm) was completed several years ago, but
|the release has been pending for some time due to the fact that the
|Jaguar ceased to be a mainstream platform, and the software, tooling,
|and procedures required to produce cartridges were lost and had to be
|recreated. "The biggest hurdle was overcoming the loss of the
|software encryption keyxi,." said Scatologic COO, Douglas Engel, who
|was one of the original BattleSphere(tm) development team. Scott
|LeGrand, Scatologic CEO, was enthusiastic about the team's effort to
|recreate the missing encryption key. He commented, "Generating a
|unique key ourselves allowed us to produce the highest quality game,
|cartridge, and packaging without resorting to risky unproven and
|expensive hardware bypassing techniques."

Songbird seems to be doing well with bypassing as shown with
Protector, but hey, breaking the code was a much cleaner way of going
about it. Good to know it can be done.

| In an unprecedented move, Scatologic has announced that
|all profits from the sale of BattleSphere(tm) will be donated to
|diabetes research. Scatologic CTO Stephanie Wukovitz stated,
|"Videogames are stereotyped as a harmful influence on society, and we
|wanted to show that they can be a very positive factor.

That is nice and all, but ALL profits?!?

| Donating the profits to diabetes research is our way of
|showing this, as well as a way to thank everyone who has helped us
|get this game produced."

That is nice and all, but ALL profits?!? :)

Common! I would hope there would be a little incentive to program
other games. Just my opinion of course, otherwise, highly noble of
you.

| A special autographed copy of BattleSphere(tm) is up
|for auction on eBay right now. As an added incentive, the high
|bidder's name will be digitally encoded into this very special
|collector's item.

(Smile) Well, I guess there was some room in that "packed"
cartridge of Battlesphere afteral.

| BattleSphere(tm) will begin full-scale shipping soon
|afterwards. BattleSphere(tm) is priced at only $74.99 plus $5.00ï¿½
|shipping and handling (Continental U.S.). Orders outside the
|continental U.S.ï¿½ will require additional charges depending on the
|destination. California residents must add 8.25% sales tax.

About the going rate for new Jaguar games these days.

| Copyright (c) 2000 Scatologic Inc. All rights reserved.
|This article may be reprinted in its entirety. BattleSphere(tm) is
|copyright and trademark 4Play/Scatologic. All rights reserved.

Imagine having Battlesphere otherwise surnamed
"Star Raiders 2000" out by 2000? What a concept. Being a fan of
cockpit style games, I know I'm going to be spending many hours on
BattleSphere and Skyhammer.

Probably good, since I've solved Wolfenstein and just about
finished off Bubsy and Kasumi Ninja. ;)

That's pretty sad, cause that's exactly what SIO2PC is designed to do. Of course, "SIO2PC" has become sort of a generic term and I can't vouch for the simpler hardware designs. (I'm sure they generally work, though.)

Someone mentioned making sure that you don't assign the same number to a virtual drive and a real drive. You should also ensure that your Atari DOS isn't setting up a RAM drive with the same number as your real drive.

Finally, some old DOS versions don't even support drives 3 and 4 unless you poke in a certain value and write DOS files.

Good luck,

Nick,
the SIO2PC guy

Actually, this is a copy of SIO2PC and an invitation to use
my software.

I've always encouraged people to build their own and to pay
a tiny shareware fee only if they felt like it, but it's
kind of rankling to see someone hawking my stuff for profit.

Not asking you not to buy it; just stating my position.

Source record: 46310

Does the computer generate any Video signal (even blankness) when it is on. when it is reset. If it does, what color is it? Does it make the grinding noise when it is turned on. I have a 400 and it is my original computer. I fixed it once already and it runs fine (i got it in 1982 and fixed it back in 83.) All the chips in the 400 are findable (not too hard to replace). You may want to check the power supply and work back from there. Even if the computer does not make video, you can hear the 6502 reset all the IO chips when it is turned on, if it is still ok. This is a good sign and tells us the address decoders, RAM ROM and the processor itself has a heartbeat still.
I have the book DE RE Atari. It has a complete schematic, a little fuzzy and tiny but recognizeable. It also describes the complete workings of the atari chipset (Pokey Antic Ctia (or Gtia) and the 6520 parallel port chip) Also has complete OS listing (for version A i think).
My computer died of a failed 74ls138 (i think its a 3 to 8 decoder). It's been a while but I think that was what was wrong. I took my girlfriends computer apart and swapped chips, one at a time, to see which was the culprit. This is not a thing I would do with rare parts, although you could test YOUR parts in a working computer to see if any of them are bad. The difference is, if your power supply is toast or something, you wont ruin new chips by frying them in your messed up computer. The best way, I think, is to take your parts one at a time and put them in a working computer. If your part is bad, that part of the computer wont work. It is also the best way to diagnose if you have more than one bad part in your computer. If you want, I could test them for you. I have put an 65816 chip (16 bit version of the 6502, only known use to my knowledge is in the APPLE II-GS) in my 400, and it works. I wished that I could have put one in my 1200XL. The 6502 chip in the 1200xl is a little different and i didnt want to pop my $80 65816. Now, im not even sure you can get a 65816 without hurting someones APPLE IIGS. I once lent it to someone with an APPLE IIc, and it worked, although Im sure some of the features (24 bit memory space AKA up to 16meg of ram) wouldnt work with out a sledgehammer and a lot of time...

I have an external AMDEK atari floppy drive controller. It lets you use its two built in Hitachi 3" (not 3.5") drives or add other regular floppy drives (5.25 or 3.5") in any combination up to four. The start IDentity of the drive is selectable from 1 to 4 and the little weirdo Hitachi drives can be yanked to accommodate all normal drives. It is single or 1050 or true double density compatible. I can use double sided drives, 80 track and that gives you 720 i think. It works with sparta dos or atari dos. Atari dos, hmm, i think i was in the possesion of a copy of Atari DOS 2.6F, but that's somewhere in my basement.

sorry about the length of this, I hope you can get your 400 fixed. I was gonna say colleen, but im not sure if that was the Internal Name that Atari

used for the 400 or not. I have an 800 also. In my family's total possesion are a 400, 800, 1200XL, 600XL, 1050 (in pieces), the Amdek unit, 410 tape player, working 850, and that damn little cheap XM301 modem. I have developed a hatred for the XM301 and would love to know what black hole exists in its microcontroller, or what bugs it has. I have a 16k BasicXL which is lovely and has PM graphics all built in. It does Dpoke and Dpeek which are word (16 bit) versions of peek and poke. Once back in 1985 i programmed eproms with my 1200xl... I use my PC now.

```
You should specify which emulator you use. Xfomer for instance, just looks
in the Xformer directory for the ROMs, the Windows 8bit emulator IIRC starts
out looking in the directory it is in, but also lets you specify a path to
the ROMs.

Yeah, that's the day in 1990 Scott asked me out, by email. One gag's
enough...

> Any chance we will see this on the NUON ?
None. VM Labs chose not to offer us funding for such a project.

> That is nice and all, but ALL profits?!?
[...]
> That is nice and all, but ALL profits?!? :)
While what we'll make is probably nothing at which to sneeze, it's about
a month of salary for one Silicon Valley coder, at best. Feels good to
do it, too, and there are large amounts of self-interest involved
(I've been diabetic since 1973).

I think it is something to do with the high speed SIO routines. All
doses I have tried with high speed io failed to work on a some
emulators.

There souldn't be any problems at all running us carts. The only
possiable one is if the cart uses artfacting to get its colours. ie
Lode Runner.
There just may be an issue using PAL carts on us machines. Due the the
fact that VBI's are a little longer and more time for each frame on
PAL computers. If a writer just gets his code to work on a PAL
machine, it will probly fall over on a NTSC one.

Maybe this has to do with the SIO rate, Sparta enables Ultraspeed on every density, MyDos especially enables "higher speed" in double density (XF551 and others, not Happy !!). Looks like some of those emulators do not like higher speed rates than 19.2k Baud; Solution: a) fix/patch the emulators b) fix/patch the DOS, maybe this helps... Greetings - Andreas Magenheimer

I don't have a solution but I admire the problem. This is also true for
me. You can use DOS 2.0s also to read DD, just press Reset (with Basic
disabled) and it will now read DD, but not write nor format...
You can also patch DOS 2.0s very easily with 5-10 Data lines, the DOS
then still appears as DOS 2.0s but will read and write SD and DD, but
format only DD !! This patched DOS works well on auto-density drives
like 1050 (never tested it with the XF551). Besides it does not provide
Dual/Medium density which is very common here in Europe (since we did
not have non-Atari, third-party DD drives and no Happy or USD
support)... greets - Andreas Magenheimer

1459. Newsgroup Permision - Atari St

Newsgroup: comp.sys.atari.8bit
Date: 2000-03-01 00:00:00 UTC
From: Niaz Khan <gospvg@hotmail.com>
Message-ID: <89j723$2g675$1@fu-berlin.de>

I would like to check with the newsgroup first that it is ok to place an advert on this group for Atari St related equipment & software I have to sell.

Please either reply to the group where I will read or reply to my email.

I apologise if I may have offended the group or any individual.

Somehow reminded me: I also did a paper design for a cable that has a "don't
care" attitude as to being used with SIO2PC or Prosys software.

Mr. Dyson has a toggle switch design he created for a universal cable that
gave me the push in that direction.

1/2 of what would be required is 4 small signal diodes, 1N914 will work
~$.08 each,
1N914 exsisting zener
PC RTS ---->|-------------{<------
PC DTR---->|----ditto, attached to band side of zener
PC RTS ----|<----1489 pin 4
PC DTR----|<----1489 pin 4

The other half would be both Nick and Steve would have to set the state of
RTS and DTR lines for compatibility. Right now I believe the Prosys software
leaves the DTR line set at true, -10V on my Tandy, so it would need a
software patch. I don't seem to have the equivalent 1050TOPC software around
to check what state it leaves the lines in.

But after figuring out it would need a software patch I got rational.
Seems like very few people are transferring software this way, even fewer
would need to have both 1050TOPC and Prosys software let alone both of them.
Sheesh, the best solution would be a software one vs hardware anyway.

Hahaha... a 4 meg cartridge on the Atari 8-bit. Now that is rightous! Yeh, much like the six pack cartridges and the type that Bill Williams came out with, you would think that it would be possible to make a cartridge that would access first an 8K chip with a program to bring up a menu. From there, you could have that 8K chip access other chips of WHATEVER limit. Sice it is bankswitching, it would jut be a matter of accessing the next storage chip in pages the Atari8 could understand.

Sherry,
Well, I have to say it will probably be some time till I have my 400 beyond the 48K barrier. I switch out between my Atari 400 (which I try to preserve) and my Atari 800. I think I will be expanding the Atari 800 since that is looking like a more likely candidate for my 64K machine.
Of course there is my Atari 800 XL.. but that is no fun. :) .

Profits are pretty loosely defined. Profits often time refer to:
Programmers time and money
Manufacturer's time and money
Investors money etc.
Whatever left over get donated. It sounds somewhat lame but really people
have to eat.

I think it's a good idea and I hope it does make profit :)

Yes it is a copy.
If somebody likes to use your (very good indeed) software with it thats fine.
I can also provide alternative software (not as good as SIO2PC or APE but
working).

>
>I've always encouraged people to build their own and to pay
>a tiny shareware fee only if they felt like it, but it's
>kind of rankling to see someone hawking my stuff for profit.

Sorry you feel that way. I didnt mean to offend you.
Is your intention to copyright the desing of SIO2PC cable?
Do you want me to pay you a share for using the design for profit?

>
>Not asking you not to buy it; just stating my position.
>
Once again - its not my intention to get in anybodies way. If there are any
ethical/legal considerations i am open to discussion.

> How about if you add flow control,so that it can actually be used at a high
> speed,and I'll consider it.
> (not all of us have those powerful 850 interfaces,you know

Well, what interface DO you have?

I haven't seen much documentation regarding hardware flow control, and
therefore have very little information about implementing it. The
hardware I used while developing Ice-T didn't support it anyway.

All I know is that users of powerful (non-SIO) interfaces such as the
Black Box can enjoy Ice-T at high speeds, with hardware flow control.

The problem with SIO-based interfaces is that the quick incoming data
flow steals cycles and slows down the software; Ice-T CAN pump out text
at 19.2kbps, but in real life a data stream of 19.2kbps bogs down the
CPU, and this isn't my fault. If you really want to use fast modems in
conjunction with a resource-heavy program like Ice-T, you need a good
non-SIO interface (and therefore even the "powerful" 850 won't cut it).

The Black Box, by the way (as reported by a user) automatically halts
flow if the software doesn't request data. That's why you will have
hardware flow control even though it isn't directly implemented in
Ice-T.

Thanks,

-itay

I am just about to get my grubby mits on a XC12 data recorder to add to my re-entry into atari 8 bits. Now if I remember correctly there were issues when it came out in reference to its reliabilty on loading and recording verses to 1010 datacorder. Has this proven to be the case long term? or was it just the fear or the new? Or is/was the issue to do with something simmilar to the old 800/xl/xe incompatabilities (few that they were).

Thanks in advance and thanks to all who replied about my carts question.

It doesn't. The Saturn is slightly superior and the Playstation a lot
better. Jag could have been good but certain design decisions shot it in
the foot. It's all a moot point now anyway.

Hmmm. Can't say I agree there! All Saturn games I played are much better
than what I have seen on my PSX. Atari and Sega delivered the best systems.
I must say Dreamcast really rocks, PSX has a very low percentage of good
games, in my opinion of course. All racers look the same and the same boring
engine is used widely.

I think, if more coders really sat down with the Jag, it could deliver some
mindblowing games.

Anybody want to sell me a Tempest for the Saturn ? I have PSX and Jag
Tempest, but I really think the Saturn version must be good. Higher frame
rate than the Jag and same gameplay. I didn't get the feel from the Tempest
on the PSX.

Get a real cool game for Saturn called Shining Force III, that's an
excellent role playing game.

I am experiencing strange problem with the Black Box HD controller.
recently I reopened my black box hard drive interface from it's storage and
tried to use it again. but experiencing weird problem:

every time I enter the bb menu, I see random atasci characters on random
places on the screen. (every time I enter the menu screen)

my suspension is that the problem is cased by bad connection to the pbi port
(dirty connectors etc...)

does anyone who uses the bb exercise this problem?, how did you solve it?

I will agree about the Sega systems, but the Jag really didn't compete. If you read the Jag FAQ, the best-guess for performance is about the level of the 32X if developers really maxed it out (which would be no small feat given how complicated the system was). That's about 1/10 the power of the Saturn, and about 1/7 the power of the PSX. With today's systems that doesn't matter nearly as much because we're at the point of diminishing returns, but 5 years ago a tenfold difference in power was huge.

The Saturn *was* more powerful than the PSX, though. It's just that nobody knew how to program the damn thing. Those few programmers that did figure it out, though, knew how to do some beautiful things. Look at VF2 - that game still stands up (and looks better than any fighter on the PSX). And of course every 2D game ever made was miles better on the Saturn. A game like Guardian Heroes could never be done on the PSX.

> I think, if more coders really sat down with the Jag, it could
deliver some

I think Tempest 2K was about as mindblowing as you'd ever get on the Jag, and I think that game's overrated, personally.

> Anybody want to sell me a Tempest for the Saturn ? I have PSX and Jag
> Tempest, but I really think the Saturn version must be good. Higher
frame
> rate than the Jag and same gameplay.

It does have a higher frame rate and overall of the two versions I prefer the Saturn version for that reason. But the Jag version does have a couple of small pluses, like better explosion sounds and 24 bit color. The resolution also seems a little better on the Jag (Saturn's resolutions were a bit odd), but that may just be because I only have an RF connector for my Jag so I get more of a blurring effect that smooths the jagged edges. Overall, though, it's basically a direct port - I would have liked to have seen some more improvements on the Saturn version (at least gimme longer webs - the game just doesn't have that infinite feeling that the original did because the webs are too small). I guess Jeff Minter didn't want to show up Atari.

You can still get Tempest 2K for the Saturn new at
http://www.videogamedepot.com.

> Get a real cool game for Saturn called Shining Force III, that's an
> excellent role playing game.

It's not for everyone, though - you need to be into tactical RPG's. I have this game myself and never finished it because I just got bored. I can see that it's an excellent example of its genre, I am just not big into tactical RPG's (I like regular RPG's a lot, though). I tried Final Fantasy Tactics on the PSX and felt the same way about it (SF3's better, though).

>
>Sorry you feel that way. I didnt mean to offend you.
>Is your intention to copyright the desing of SIO2PC cable?
>Do you want me to pay you a share for using the design for profit?
>

I don't think the design could be copyrighted (if that's the right term).
Because it's pretty trivial. The cable is part of a system. It's one
precent, the other 99% of my thousands of hours of work is in the software.
Of course to a user, the opposite is true. Most of the trouble and/or
expense is in building or buying the cable. Downloading the software is
free!

The bottom line is, I probably don't have room to complain, since I've told
people they can use my software and pay shareware only if they felt like it.
(None do ;^)) As I said, it just struck me wrong.

I did have an Atari vendor ask me years ago if he could copy my interface
for sale and advise people to download my software to make it go. I said,
"I'd rather you didn't", and as far as I know--he didn't.

For faster service, Please direct all replies through E-Mail to Ben at: atari@benjamin.net or bensmith@teleport.com instead of NewsGroups as I find it hard to keep up with NewsGroups.

FREE Catalogs for Classic Atari 8 Bit & Atari ST Computers! Hard-Ware, SoftWare, Books & Accessories! View Atari Catalogs on the Web at http://www.atari.benjamin.net And Jump to my FTP site linked to my Web Site so you can Download Free Catalogs or FTP directly to my site at: ftp.teleport.com/vendors/bensmith/ If you can't get Catalogs that way, Feel free to Request catalogs through E-Mail. Really, it's not an inconvenience. I do ask that you specify Atari 8 Bit, Atari ST or Both! Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail. Please let me know if I can attach text files to your E-Mail. Catalogs are just regular ASCII text files so you can download them into your text editor and view them, edit them or print them out! It would make things easier for me if you take my Catalogs, load them into your text editor, delete what you don't want and E-Mail me the rest! To expedite things, include your complete Mailing address so I can figure your Shipping/Postage & Handling. I'll be back after the weekend.

e-mail: atari@benjamin.net

I've added more and will be adding more Hardware, Software, Books and Accessories for Classic 8 Bit and Atari ST. So checkout what's new on my WebSite. In Fact, check it regularly as my Catalogs are updated regularly. Customer's are served, first come, first serve! I have 6 different Catalogs, and my SoftWare Catalogs are my largest. They have the biggest Byte Count. You should see my inventory! I have TruckLoads of HardWare, Boxes & Boxes of Software & Libraries of Books & Reference Material for the Classic Atari 8 Bit & Atari ST! And remember, if you can't come see me today, come see me tomorrow!

1502. Schematic for 800 needed

Newsgroup: comp.sys.atari.8bit
Date: 2000-03-03 00:00:00 UTC
From: Mark Milbourne <milbourn@usit.net>
Message-ID: <38BF1C59.13DC5B53@usit.net>
Source record: 46213

Thanks to several who responsed to my plea for help with my apparently
bad 1050 drive. We have determined that the 1050 is probably OK, but
the computer is not pulling the COMMAND line low while sending the
intial power-on "hello" messages to try to find a drive. The incoming
data is intact but the drive is not paying attention because the COMMAND
line isn't active.

SO....
I need a copy of the 800 schematic or somebody with one to tell me which
pin on the 6520 PIA chip drives COMMAND (pin 7 - middle of bottom row)
on the SIO port. There is probably a buffer/driver chip in between like
U1 on the 1050, so if I can find the COMMAND signal intact on the 6520,
then I know I need to replace just the driver in between. But if
nothing on the 6520, then I replace it.

Thanks in advance.
Mark Milbourne

Best way probably, other than hooking a real 1050 to the PC via ProSys
cable.

What that means is a printer that can accept and act upon character
data by rasterizing the shape of the letter internal to the printer.
Many modern printers are what are typically called "Win" printers.
This means they do not have the full brains it takes and the computer
must act as part of the brains.

There once was an Atari laser printer that I guess you could call a
"ST printer" for the same reasons.

They're suing GT Interactive and a number of small developers that can't afford to defend themselves against a megacompany like Hasbro. It's pure bullying.

I can understand trying to protect intellectual property, but I don't think Hasbro has any copyright on the actual design of their games, nor do I think they could get one. They can copyright the code, the graphics, the instructions to play the game, but can they copyright the IDEA? If anything, they would have to patent it, and it's 20 years too late for that.

This is just another freedom-of-expression versus intellectual-property question that I think has gone too far. I'll vote for freedom on this one.

Mark-
My schematic is pretty darned hard to read. But it looks like the
Command line from the SIO port goes untouched through the Power-Supply
Board, enters the Mother-Board where it is conditioned with a capacitor,
passes through a 100 ohm resistor, is tied "high" with a 4.7k resistor
then goes straight to pin 19 of the PIA. There is no buffer/inverter
between the SIO port and the PIA.

Hope this helps.
-Rhett

PS. I guess there must not be an buffering, because I managed to kill my
Atar 400 when I was about 11 by shorting out the SIO pins. The best part,
is that my friend did the same thing years later after I sold it to him.

Hello again everybody!

I just moved (again) to another city and am now trying to
rebuild my contacts database :)

Anyway, I'd like to know where to locate, by now, the following
people (random order):

Pawel "Pirx" Kalinowski
Freddy "Frankenstein" Offenga
Vidar "Hawk" Olavesen
Peter "Jacomo Leopardi" Dell
Joakim "WosFilm" Atterhal

I said "by now" because there are much more I had contact with;
gotta find their names :-)

Furthermore, I would like to know how to contact the "Closer To
Home"-BBS (USA). I remember it could be accessed via telnet (at
least so it was about 5 months ago).

Please, email and/or CC me your reply because I cannot check the
newsgroups very often.

Thanks a lot in advance!

Best regards,

Martin (a.k.a. Pimpf)

Welcome to comp.sys.atari.8bit, the Usenet newsgroup for discussion about the Atari 8-bit family of computers! These include the 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, 800XE, and the XE Game System.

Many topics are covered over and over again. To help alleviate this trend, several people volunteer their time and energies by maintaining Periodic Informational Postings for this newsgroup. Please take a moment to refer to these documents before posting to comp.sys.atari.8bit. The answer to your question may already be readily available!

Users of comp.sys.atari.8bit actively maintain the following Periodic Informational Postings:

Thanks for the offer, Greg. I found a page on the 'Net that described how to install the interface inside my 130XE and just install a standard serial port on the back side. I figured this was a better solution since I didn't have to hack an SIO cable. I'll let you know how it turns out.

P.S. - I'm also going to do the video improvement at the same time. Incredible that just a couple of resistors could improve the colors and sharpness on my screen.

Dan,

> I'm trying to find an old Atari 800 video game made by Datavision.
> It was a Bruce Lee type game.
>
> Can anyone recommend a site or place to locate it?

I do not know where you can find it but it sounds like you
are referring to the game 'Bruce Lee' which was made by
Datasoft, not Datavision.

I own only one issue of the Atari Connection magazine, and I love it. It was the first Atari related magazine that I got immediately after I bought my first computer (ever), an Atari 600XL, in 1983.

It would mean a lot to me if I got an opportunity to buy other issues of this magazine. I am also interested in buying extra copies of the issue I have already got, the one with the LOGO vs BASIC discussion.

PLEASE contact me if you own old issues of Atari Connection that you want to sell. I will pay in advance for the magazines, packaging and shipping to Sweden.

Usually, it means that your computer just does not like the Black
box....I have found that replacing the CPU, or the whole computer fixes
the problem.....however, as someone already said, Bob published some fixes
that get rid of stability problems. However, if you have other Ataris
hanging around, it is probably easier to swap them out.

I'll start off by saying the current situation is a mess and I don't endorse
it, but...
<hugg@my-deja.com> wrote in message news:89nmrmsvv1@nnrp1.deja.com...
> They're suing GT Interactive and a number of small developers that can't
> afford to defend themselves against a megacompany like Hasbro. It's
> pure bullying.
It is expensive, but sheesh! Spent $23k of my personal funds last year on
lawyers. I would have much rather spent a year living abroad. It shouldn't
be that much of a strain on a company. I don't think that I or the companies
should necessarily have to spend the money, but then Hasbro shouldn't have
to either. The case is really the same case, I mean Hasbro prepares a case
for X, and uses it for Y and Z. Y and Z stall while X goes before a judge,
if Hasbro loses Y and Z use the results of that case. Likewise if Hasbro
wins, Y and Z get out of Dodge.

Officially the case would have to be appealed before any new 'laws' would go
into the books. That is, you need a lower court decision that has to be
appealed, then if the case is upheld by the appeal court it is ~law.
>
> I can understand trying to protect intellectual property, but I don't
> think Hasbro has any copyright on the actual design of their games, nor
> do I think they could get one. They can copyright the code, the
I'm not sure they have a copyright either, looked at a Defender cart and it
says copyright Atari, Tradmark Williams, go figure.

I think this implies they are defending their licencing rights. I don't know
jack about licencing rights, even how to spell it.<grin>
> graphics, the instructions to play the game, but can they copyright the
> IDEA? If anything, they would have to patent it, and it's 20 years too
> late for that.
I though this case was established in two cases. Lotus Development Corp Vs
Borland, for speadsheets and Apple Corp Vs Microsoft over GUIs.

It was a terrible decision, heck I can say anything that went the wrong way
from my POV is a terrible decision, but look and feel is copyrightable.
>
> This is just another freedom-of-expression versus intellectual-property
> question that I think has gone too far. I'll vote for freedom on this
> one.
Our legal system really sucks right now. Constitutional right to petition
for the redress of grievances has been interpreted to "File lawsuits often
with little reason". I remember seeing a 60 minutes episode<?> where a guy
had sued he former landlady numerous times after she kicked him out for
violating his lease. I think he was filing and losing about a case a month,

but been too long to remember. The judges could tell him the legalese equivalent of "get a life loser", but they couldn't stop him from filing lawsuits: Constitutional right to harass people as long as you do it with lawsuits.

Our legal system from DAs to Judges to the law makers themselves have a huge elected componet. Make the right decision, do the right prosecution, get the right special interest law passed and it is a golden ticket for a free ride in the next election.

1521. 800XL up for grabs to a new home

Newsgroup: comp.sys.atari.8bit
Date: 2000-03-03 00:00:00 UTC
From: "David A. Elliott" <delliott@nac.net>
Message-ID: <38c00523@nntp2.nac.net>
Source record: 46232

Hello all,
I usually frequent the video games groups, but I figured I would hit
this one as well....
A year ago, I bought an Atari 800XL, a 410 tape recorder and an 1050 disk
drive, all with the intention of learning to program it.
Well, I do not have the time any more and have accumulated a few games
and programs and books for it and I regretfully have to find a new home for
it.
This is what programs I have:
All cart only:
Centipede
Millipede
Pac-Man
Ms Pac-Man
Donkey Kong
With box, instructions, etc:
Miner 2049'er
Star Trek SOS
Atari Assembler Editor
Frogger (sealed)
Books:
Master Memory Map for the Atari
Games for the Atari
Compute's First Book of Atari Graphics
The sustem comes with all hook-ups and works perfectly. I love it, but
again it is not being used to it's potental. E-mail me at delliott@nac.net
with offers. Best offer will get it and all offers considered.

Cross-posted to: rec.games.video.classic,rec.games.video.atari,comp.sys.atari.8bit,rec.games.vectrex

Hi everyone:

I know that *some* of you know about this event already, but I just wanted to give everyone an update (or an introduction, as the case may be) to what is shaping up to be a terrific event coming up April 14-16, 2000. If you have any questions, please feel free to email me. Or if you have some cool classic gaming items you'd like to bring and do a session on (even just an informal show'n'tell kind of thing), we'd love to have your participation. Or bring your goodies for sale or trade. Or just come, play, browse, shop, and meet some fellow gamers and collectors.

** PhillyClassic, Philadelphia's first annual Classic Gamers' Event! **

** UPDATE: 3.3.2000 **
Many sponsors and friends added. These folks are either coming to the event, sending a door prize or tournament prize, or BOTH! For full details, see:

http://members.aol.com/davidn9000/philly.html

Here's a sampling of what you'll have a shot at winning:
3 Missile Commands for PSX (donated by Hasbro)
3 Space Invaders for N64, GBC, and PSX (donated by Activision)
Asteroids for PSX (donated by Activision)
Intellivision Collection for PSX (donated by Activision)
7 *NEW revision of Ed. 5* Digital Press Guides (donated by Joe Santulli of Digital Press)
3 copies of Leonard Herman's book "PHOENIX: The Fall and Rise of Video Games"
Verrrry cool AdventureVision logo T-shirts donated by Jeff Folejewski of AdventureVision.com
AND MORE STILL TO COME!

Website has complete details, including
* Information/scheduled events
* Hotel accomodation info/online reservations
* Door to Door driving directions and interactive maps
* Ticket information
* How To Link to Us banners/ads available for YOUR classic game related site!

http://members.aol.com/davidn9000/philly.html

** UPDATE: 1.31.2000 **
TNT Amusements, a local coin-op vendor is allowing us to borrow a Galaga coin-op for a Galaga tournament!

** INITIAL POST: 1.28.2000 **
Hey all! I'm here to announce the first annual PhillyClassic East Coast Classic

Gamer's Event. We are organizing an event to bring classic gamers together as a group for a weekend of trading, selling, and storytelling!

The weekend of April 14th, 15th, and 16th will be one to remember as classic gamers unite for a weekend of hardcore gaming! Planned events include casual trading/selling, *tournaments*, *auction*, show-and-tell, and a general good time by all!

We have rented a 1000 sq ft conference room at the Villanova University Conference Center for the event, which means enough room for a lot of people to come and setup the pride and joy of their collections, and even a little tradebait!

The conference center is COMPLETELY PRIVATE, has security, FREE PARKING and LOTS OF IT, and is located in a higher class area, so we shouldn't have any problems with anyone worrying about their rarities being pilfered.

The tentative times are as follows:

Friday: 7pm - whenever -- Setup Night/ meet 'n' greet/ informal gaming/ early

bird trading
Saturday: 10am - 7pm (will probably go longer) -- MAIN DAY
Sunday: 9am - noon -- Packup, Final Goodbyes

If you have any questions or would like to help organize a part of the event PLEASE e-mail David Newman davidnewman@adelphia.net) or Chuck Whitby (intv-sama@worldnet.att.net). If you plan on attending, please purchase your tickets early and make those hotel reservations!

Thank you very much!

1524. Is there a free atari 800 emulator for the mac?

i know of at least two (Wacke and Rainbow), but they are not free,
though they have downloadable demo versions. See the pages

http://www.shenleyfields.demon.co.uk/rainbow.html

http://www.ctaz.com/~jlfenton/Wacke.html

I think some of the free/open-source emulators, which typically are
better than the commercial ones, have been ported to the Mac, but I
don't have the info here. It'd be nice if someone ported the Atari800
emulator to the Mac.

As for the roms, they are many places on the web where you can download
them. Just search the web a bit, or contact me directly.

Source record: 46238

Once again, profuse thanks to several who provided quick and helpful info!
COMMAND is indeed connected directly to pin 19 on the 6520 through 100 ohms

with something like a 4.7k pullup. Pulls high at power-on but otherwise no

activity concurrent with pulses on the DATA OUT, so it must be bad there.

So after thinking my 1050 was bad, it looks like we're on the home
stretch. Have an e-mail into myatari.com to see about a replacement 6520.

Thanks everyone!

Mark Milbourne

In the case of spreadsheets, the precedent was that Visicalc predated
Lotus, and Lotus took their look and feel, not to mention that Visicalc
wasn't properly copyrighted in the first place, so any spreadsheet that
emulates Visicalc at its base is clear.

Apple vs. MS got muddied by several factors, including that Apple was
given their base look and feel by Xerox PARC (under protest of the PARC
researchers), and Apple was sloppy on how they distributed things before
properly protecting them, thus giving MS an inside peek without proper
protection up front. This latter was ultimately settled in a single phone
call by Jobs to Gates just after he returned to Apple as the iCEO.

The Starsabre is a British blade. Please reverse the r and e
to reply to me directly.

Might also be a problem with a dirty edge connector on either the black box
side or the computer side on the parallel bus.

I find that if I insert and remove and insert again several times, it keeps me
going for
a while. Also, you can take a clean pencil eraser and clean the contacts with
it. That's
if you're using the 130XE connector.

For one thing, when running the PC Xformer, an individual Atari file can be loaded same as if it were an .atr or .xfd image file. Then you can "L" run these files without being obliged to combine them on a disk image. Or, on the other hand, you might assign them to individual drives and then copy each of them to another drive holding a disk-image file. I've found it quite a convenience to have a large number of drives available.

Not sure those cases apply to games. Think of all the "legal" clones
in gaming history. Atari 400/800 Jawbreaker vs. Atari's Pac-Man port
is probably the most visible and referenced example.

Sure, there is the KC Munchkin case, but I think Magnavox just got
unlucky in the courts on that one. Overall, precedence is that you
can copy gameplay as long as you give it a different name and slightly
different graphics.

God knows that there are more recent examples of this... Just about
any racing game could be considered a clone of another racing game
based on gameplay, or quake-style games.

I have a copy too. Good ole' Cap'n Beeble! Between that and Spelunker
I wasted too many hours during my sophomore year in college and my GPA
never recovered!

Anybody else discover the bug where you can squish through the crack in
the floor and fly around in the solid area?

I need a 6520 PIA chip for my 800 in trade before I could make you a
copy! :-)

Got a few things for auction. Good stuff and low starting prices so
check them out! This is among the last of my 8-bit stuff. I have an
SIO2PC cable, two XF551s in great shape, and some carts including a
silver label Miner 2049er---watch for a post when I put those up in the
next couple of days if you are interested, or make me an offer right
now!

Action! Toolkit disk & manual:
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=275721842

AtariWriter cart, box & manual, with Antic Printer Drivers Construction
Set:
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=275727826

Atari LOGO cart and manuals:
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=275714425

Supra MicroPrint parallel interface:
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=275704534

Thanks for reading!

"Have been," is one. "Will be," is approximately 1000.

With meddlesome charm,
MegaData
